I. INTRODUCTION

Q. PLEASE STATE YOUR NAME, OCCUPATION AND BUSINESS ADDRESS.

A. My name is Pauline M. Ahern and I am a Principal of AUS Consultants. My business address is 155 Gaither Drive, Suite A, Mt. Laurel, New Jersey 08054.

Q. PLEASE SUMMARIZE YOUR EDUCATIONAL BACKGROUND AND PROFESSIONAL EXPERIENCE.

A. I am a graduate of Clark University, Worcester, MA, where I received a Bachelor of Arts degree with honors in Economics in 1973. In 1991, I received a Master of Business Administration with high honors from Rutgers University.

In June 1988, I joined AUS Consultants as a Financial Analyst and am now a Principal. I am responsible for the preparation of all fair rate of return and capital structure exhibits for AUS Consultants. I have offered expert testimony on behalf of investor-owned utilities before twenty-four state regulatory commissions. The details of these appearances, as well as details of my educational background, are shown in Appendix A supplementing this testimony.

I also calculate and maintain the A.G.A. Index under contract with the American Gas Association (A.G.A.). The A.G.A. Index is a market capitalization weighted index of the common stocks of about 70 corporate members of the A.G.A.

I have co-authored an article with Frank J. Hanley, a Principal & Director of AUS Consultants entitled "Comparable Earnings: New Life for an Old Precept" which was published in the American Gas Association's Financial

1 Quarterly Review, Summer 1994. I also assisted in the preparation of an
2 article authored by Frank J. Hanley and A. Gerald Harris entitled "Does
3 Diversification Increase the Cost of Equity Capital?" published in the July 15,
4 1991 issue of Public Utilities Fortnightly.

5 I am a member of the Society of Utility and Regulatory Financial
6 Analysts, formerly the National Society of Rate of Return Analysts serving as
7 President for 2006-2008 and Secretary/Treasurer for 2004-2006. In 1992, I
8 was awarded the professional designation "Certified Rate of Return Analyst"
9 (CRRRA) by the National Society of Rate of Return Analysts. This designation is
10 based upon education, experience and the successful completion of a
11 comprehensive written examination.

12 I am an associate member of the National Association of Water
13 Companies, serving on its Finance Committee, a member of the Energy
14 Association of Pennsylvania, formerly the Pennsylvania Gas Association, and a
15 member of the American Finance and Financial Management Associations.

16 **Q. WHAT IS THE PURPOSE OF YOUR TESTIMONY?**

17 A. The purpose is to provide testimony on behalf of Utilities Services of South
18 Carolina, Inc. (USSC or the Company) in the form of the fair rate of return,
19 including common equity cost rate, senior capital cost rate and capital structure
20 which it should be afforded the opportunity to earn on its jurisdictional water
21 and sewer rate bases.

22 **Q. WHAT IS YOUR RECOMMENDED OVERALL FAIR RATE OF RETURN?**

23 A. I recommend that the Public Service Commission of South Carolina (PSC SC

or the Commission) authorize the Company the opportunity to earn an overall rate of return in the range of 8.42% - 8.66% based upon the consolidated capital structure at December 31, 2006 of Utilities, Inc., USSC's parent, consisting of 59.83% long-term debt and 40.17% common equity at cost rates of 6.42% and a range of 11.40% - 12.00%, respectively, as summarized in Table 1 below:

Table 1

	<u>Capital Structure Ratios</u>	<u>Cost Rate</u>	<u>Weighted Return</u>
Long-Term Debt	59.83%	6.60%	3.84%
Common Equity	<u>40.17</u>	11.40-12.00	<u>4.58-4.82</u>
Total	<u>100.00%</u>		<u>8.42%-8.66%</u>

Q. HAVE YOU PREPARED AN EXHIBIT WHICH SUPPORTS YOUR RECOMMENDED COMMON EQUITY COST RATE?

A. Yes, I have. It has been marked for identification as Exhibit No. ___ and consists of Schedules PMA-1 through PMA-13.

II. SUMMARY

Q. PLEASE SUMMARIZE YOUR RECOMMENDED COMMON EQUITY COST RATE RANGE.

A. My recommended common equity cost rate range of 11.40% - 12.00% is summarized on Schedule PMA-1, page 2. Because USSC's common stock is not publicly traded, a market-based common equity cost rate cannot be determined directly for USSC. Therefore, in arriving at my recommended common equity cost rate range of 11.40% - 12.00%, I assessed the market-

1 based cost rates of companies of relatively similar risk, i.e., proxy group(s), for
2 insight into a recommended common equity cost rate applicable to USSC and
3 suitable for cost of capital purposes. It is appropriate to look at a proxy group
4 or groups of companies as similar in risk as possible whose common stocks
5 are actively traded for insight into an appropriate common equity cost rate
6 applicable to USSC and then adjust the results upward to reflect USSC's
7 relative business risk relative to the proxy groups. Using other utilities of
8 relatively comparable risk as proxies is consistent with the principles of fair rate
9 of return established in the Hope¹ and Bluefield² cases and adds reliability to
10 the informed expert judgment used in arriving at a recommended common
11 equity cost rate. However, no proxy group can be selected to be identical in
12 risk to USSC and therefore, the proxy groups' results must be adjusted to
13 reflect the greater relative business risk of USSC as will be subsequently
14 discussed in detail. I have evaluated the market data of two proxy groups of
15 water companies in arriving at my recommended common equity cost rate.
16 The bases of selection are described below.

17 As explained in more detail below, my analysis reflects current capital
18 market conditions and results from the application of four well-tested market-
19 based cost of common equity models, the Discounted Cash Flow (DCF)
20 approach, the Risk Premium Model (RPM), the Capital Asset Pricing Model
21 (CAPM), and the Comparable Earnings Model (CEM).

¹ Federal Power Commission v. Hope Natural Gas Co., 320 U.S. 591 (1944).

² Bluefield Water Works Improvement Co. v. Public Serv. Comm'n, 262 U.S. 679 (1922).

1 The results derived from each are as follows:

2 Table 2

	Proxy Group of Eight AUS Utility Reports <u>Water Cos.</u>	Proxy Group of Four Value Line (Std. Ed.) <u>Water Cos.</u>
3 Discounted Cash Flow Model	9.8%	10.1%
4 Risk Premium Model	10.8	11.0
5 Capital Asset Pricing Model	10.2	10.5
6 Comparable Earnings Model	14.3	14.2
7		
8		
9 Indicated Common Equity		
10 Cost Rate Before		
11 Business Risk Adjustment	10.80%	-- 11.40%
12		
13 Business Risk Adjustment	<u>0.30</u>	<u>0.30</u>
14		
15 Indicated Common Equity		
16 Cost Rate After		
17 Adjustment for Business Risk	11.10%	-- 11.70%
18		
19 Financial Risk Adjustment	<u>0.30</u>	<u>0.30</u>
20		
21 Recommended Range of

23		
24		
25		
26		
27		
28		
29		

30 After reviewing the cost rates based upon the four models, I conclude
31 that a range of common equity cost rate, before adjustment for business risk, of
32 10.80% to 11.40% is indicated based upon the application of all four models to
33 the proxy group of eight AUS Utility Reports water companies and four Value
34 Line (Standard Edition) water companies. After applying a business risk
35 adjustment of 30 basis points (0.30%) due to USSC's small size and financial
36 risk adjustment of 30 basis points due to USSC's greater financial risk relative
37 to the two proxy groups as will be discussed in detail subsequently, my
38 recommended common equity cost rate range is 11.40% to 12.00% applicable
39 to the Company's proposed common equity ratio of 40.17%. My
recommended common equity cost rate of 11.40% - 12.00% is based upon the

midpoint of this range and is applicable to the common equity financed portion of the Company's jurisdictional rate base.

III. GENERAL PRINCIPLES

Q. WHAT GENERAL PRINCIPLES HAVE YOU CONSIDERED IN ARRIVING AT YOUR RECOMMENDED COMMON EQUITY COST RATE RANGE OF 11.40% - 12.00%?

A. In unregulated industries, the competition of the marketplace is the principal determinant of the price of a product or service. In the case of regulated public utilities, regulation must act as a substitute for such marketplace competition. Consequently, marketplace data must be relied upon to assure that the utility can fulfill its obligations to the public and provide adequate service at all times. This requires a level of earnings sufficient to maintain the integrity of presently invested capital and permit the attraction of needed new capital at a reasonable cost in competition with other firms of comparable risk, consistent with the fair rate of return standards established by the U.S. Supreme Court in the Hope and Bluefield cases cited previously. Consequently, in my determination of common equity cost rate, I have evaluated data gathered from the marketplace for utilities as similar in risk as possible to USSC.

IV. BUSINESS RISK

Q. PLEASE DEFINE BUSINESS RISK AND EXPLAIN WHY IT IS IMPORTANT TO THE DETERMINATION OF A FAIR RATE OF RETURN.

A. Business risk incorporates all of the risks of a firm other than financial risk, which will be discussed subsequently. Examples of business risk include the

1 quality of management, the regulatory environment, customer mix, service
2 territory growth and the like, which have a direct bearing on earnings.

3 Business risk is important to the determination of a fair rate of return
4 because the greater the level of risk, the greater the rate of return investors
5 demand, consistent with the basic financial precept of risk and return.

6 **Q. PLEASE DISCUSS THE BUSINESS RISKS FACING THE WATER**
7 **INDUSTRY IN GENERAL.**

8 A. The water utility industry faces significant risks related to replacing aging
9 transmission and distribution systems. Value Line Investment Survey³
10 observes:

11 ...[m]aintenance costs are expected to remain extremely high, as
12 infrastructure demands grow more stringent. Many of the current
13 infrastructures are more than 100 years old and in need of
14 serious upkeep, or even complete replacement in some cases.
15 Making matters worse, the Environmental Protection Agency
16 (EPA) continues to increase its water purification standards, given
17 the geopolitical volatility worldwide and the threat of bio-terrorist
18 actions on U.S. water systems. In all, infrastructure repair costs
19 are expected to climb into the hundreds of millions of dollars over
20 the next two decades.

21
22 This puts smaller companies in the industry at a distinct
23 disadvantage. Many do not have the resources to meet the
24 higher burdens and are deciding to merge with larger, more
25 financially sound enterprises. As a result, some of the biggest
26 water utility companies are growing bigger, faster than ever.

27
28 * * * *

29
30 We recommend that most investors look elsewhere. Despite the
31 necessity for water, the capital intensive nature of the industry
32 washes away any growth appeal.

33
34 In addition, because the water industry is much more capital-intensive than the

³ Value Line Investment Survey, April 27, 2007.

1 electric, natural gas or telephone industries, the investment required to produce
2 a dollar of revenue is greater. And, because investor-owned water utilities
3 typically do not receive federal funds for infrastructure replacement, the
4 challenge to investor-owned water utilities is exacerbated and their access to
5 financing is restricted, thus increasing risk.

6 The National Association of Regulatory Commissioners (NARUC) has
7 also highlighted the challenges facing the water industry stemming from its
8 capital intensity. NARUC's Board of Directors adopted a resolution in July
9 2006, taking the position that⁴:

10 WHEREAS, To meet the challenges of the water and wastewater
11 industry which may face a combined capital investment
12 requirement nearing one trillion dollars over a 20-year period, the
13 following policies and mechanisms were identified to help ensure
14 sustainable practices in promoting needed capital investment and
15 cost-effective rates: a) the use of prospectively relevant test
16 years; b) the distribution system improvement charge; c)
17 construction work in progress; d) pass-through adjustments; e)
18 staff-assisted rate cases; f) consolidation to achieve economies of
19 scale; g) acquisition adjustment policies to promote consolidation
20 and elimination of non-viable systems; h) a streamlined rate case
21 process; i) mediation and settlement procedures; j) defined
22 timeframes for rate cases; k) integrated water resource
23 management; l) a fair return on capital investment; *and* m)
24 improved communications with ratepayers and stakeholders; *and*
25

26 WHEREAS, Due to the massive capital investment required to
27 meet current and future water quality and infrastructure
28 requirements, adequately adjusting allowed equity returns to
29 recognize industry risk in order to provide a fair return on invested
30 capital was recognized as crucial...
31

32 RESOLVED, That the National Association of Regulatory Utility
33 Commissions (NARUC), convened in its July 2006 Summer
34 Meetings in Austin, Texas, conceptually supports review and

⁴ "Resolution Supporting Consideration of Regulatory Policies Deemed as 'Best Practices'", Sponsored by the Committee on Water. Adopted by the NARUC Board of Directors, July 27, 2006.

1 consideration of the innovative regulatory policies and practices
2 identified herein as "best practices;" *and be it further*
3

4 RESOLVED, That NARUC recommends that economic regulators
5 consider and adopt as many as appropriate of the regulatory
6 mechanisms identified herein as best practices...
7

8 The water utility industry also experiences lower relative depreciation
9 rates. Lower depreciation rates, as one of the principal sources of internal
10 cash flows for all utilities, mean that water utility depreciation as a source of
11 internally-generated cash is far less than for electric, natural gas or telephone
12 utilities. Water utilities' assets have longer lives and, hence, longer capital
13 recovery periods. As such, water utilities face greater risk due to inflation
14 which results in a higher replacement cost per dollar of net plant than for other
15 types of utilities. Water utilities experienced an average depreciation rate of
16 2.5% for 2006 with USSC experiencing a nearly identical depreciation rate of
17 2.6%. In contrast, in 2006 the electric, combination electric and gas, natural
18 gas or telephone industries, experienced average depreciation rates of 4.2%,
19 4.4%, 4.3% and 6.5%, respectively.

20 In addition, as noted by S&P⁵:

21 Environmental regulations, which can be particularly stringent for
22 water utilities, impact credit quality. Mandatory compliance with
23 environmental legislation is often quite capital intensive. This is
24 particularly so in the areas of wastewater discharge and drinking
25 water quality. In most jurisdictions observed by Standard &
26 Poor's, pressures from environmental standards is likely to
27 increase. High compliance costs can impact a water utility's
28 creditworthiness if their financing is up-front and their recovery is
29 over a long period, potentially putting stress on the financial
30 profile in the short term.
31

⁵ Standard & Poor's, Criteria: Infrastructure Finance, Water and Wastewater Utilities, Projects and Concessions, September 1998, p. 47.

1 A key rating consideration is the extent of the link between a
2 water utility's legislated environmental standards and its rate-
3 setting mechanism. Stringent environmental rules requiring
4 expensive upgrade and compliance costs are not necessarily a
5 negative rating factor, so long as the utility has a flexible and
6 transparent process for passing the costs through to consumers,
7 and these consumers are willing and able to bear these costs.
8 Standard & Poor's considers whether the environmental and
9 economic regulators are acting in isolation, or perhaps have
10 different constituencies.

11
12 Moody's⁶ also notes that:

13
14 We expect that the credit quality of the investor-owned U.S. water
15 utilities will likely deteriorate over the next several years, due to
16 ongoing large capital spending requirements in the industry.
17 Larger capital expenditures facing the water utility industry result
18 from the following factors:

- 19
20
- Continued federal and state environmental compliance requirements;
 - Higher capital investments for constructing modern water treatment and filtration facilities;
 - Ongoing improvement of maturing distribution and delivery infrastructure; and
 - Heightened security measures for emergency preparedness designed to prevent potential terrorist acts.
- 28

29 Given the overwhelming importance of protecting the public
30 health, the water utility industry remains regulated by the federal
31 and state regulatory agencies. As a result of this importance, the
32 level of state regulators' responsiveness is critical in enabling the
33 water utilities to maintain their financial integrity. In addition,
34 when utilities are permitted a fair rate of return and timely rate
35 adjustments to reflect the costs of providing this essential service,
36 they will be more able to implement the necessary safeguards to
37 protect the public health.

38
39 In addition, the water utility industry, as well as the electric and natural
40 gas utility industries, faces the need for increased funds to finance the

⁶ Moody's Investors Service, Global Credit Research, "Credit Risks and Increasing for U.S. Investor Owned Water Utilities", Special Comment, January 2004, p. 5.

1 increasing security costs required to protect the water supply and infrastructure
2 from potential terrorist attacks in the post-September 11, 2001, world as noted
3 by Value Line above.

4 In view of the foregoing, it is clear that the water utility industry's high
5 degree of capital intensity coupled with the need for substantial infrastructure
6 capital spending and increased anti-terrorism and anti-bioterrorism security
7 spending, requires regulatory support in the form of adequate and timely rate
8 relief, as recognized by NARUC, so water utilities will be able to successfully
9 meet the challenges they face.

10 **Q. DOES USSC FACE ADDITIONAL EXTRAORDINARY BUSINESS RISK?**

11 A. Yes. USSC's smaller size, i.e., combined total capital of \$6.591 million at
12 December 31, 2006 relative to average total capital of \$555.480 million in 2006
13 for the proxy group of eight AUS Utility Reports water companies (see page 3
14 of Schedule PMA-1), and \$898.745 million for the proxy group of four Value
15 Line (Std. Ed.) water companies indicates greater relative business risk
16 because all else equal, size has a bearing on risk.

17 **Q. PLEASE EXPLAIN WHY SIZE HAS A BEARING ON BUSINESS RISK.**

18 A. Smaller companies are less capable of coping with significant events which
19 affect sales, revenues and earnings.

20 In general, the loss of revenues from a few larger customers, for
21 example, would have a greater effect on a small company than on a much
22 larger company with a larger customer base. In addition, the effect of extreme
23 weather conditions, i.e., prolonged droughts or extremely wet weather will have

a greater effect on a small operating water company than upon the much larger, more geographically diverse, publicly traded holding companies. Another factor contributing to the risk effects of size include the fact that investors demand greater returns to compensate for a lack of marketability and liquidity. Because USSC is the regulated utility to whose rate base the Commission's ultimately allowed overall cost of capital and fair rate of return will be applied, the relevant risk reflected in the cost of capital must be that of USSC, including the impact of its small size on common equity cost rate. Size is an important factor which affects common equity cost rate, and USSC is significantly smaller than the average company in each proxy group based upon total investor-provided capital as shown below:

Table 3

	2006 Total Capital (\$ millions)	Times Greater than The Company	Market Capitalization(1) (\$ Millions)	Times Greater than the Company
Proxy Group of Eight AUS Utility Reports Water Companies	\$555.480	84.3x	\$710.535	47.4x
Proxy Group of Four Value Line (Std. Ed.) Water Companies	898.745	136.4x	1,158.741	76.9x
Utilities Services of South Carolina, Inc.	6.591		14.988 (2) 15.074 (3)	

(1) From Schedule PMA-1, page 3.

(2) Based upon the average market-to-book ratio of the proxy group of eight AUS Utility Reports water companies.

(3) Based upon the average market-to-book ratio of the proxy group of four Value Line (Std. Ed.) water companies.

Table 3 above also shows the results of my study of the market capitalization of the proxy groups of eight AUS Utility Reports water companies

1 and four Value Line (Std. Ed.) water companies. The results are shown on
2 page 5 of Schedule PMA-1 which summarizes the market capitalizations as of
3 July 10, 2007.

4 USSC's common stock is not publicly traded. Consequently, I have
5 assumed that if it were publicly traded, the common shares would be selling at
6 the same market-to-book ratio as the average market-to-book ratio for each
7 proxy group, or 227.4% (eight water companies) and 228.7% (four water
8 companies) on July 10, 2007. Hence, USSC's market capitalization is
9 estimated at \$14.988 million and \$15.074 million based upon the average
10 market-to-book ratios of each proxy group, respectively, as of July 10, 2007. In
11 contrast, the market capitalization of the average AUS Utility Reports water
12 company was \$710.535 million on July 10, 2007, or 47.4 times larger than
13 USSC's estimated market capitalization. In addition, the market capitalization
14 of the average Value Line (Std. Ed.) water company was \$1.158 billion on July
15 10, 2007 or 76.9 times larger than USSC. It is conventional wisdom, supported
16 by actual returns over time, and a general premise contained in basic finance
17 textbooks, that smaller companies tend to be more risky causing investors to
18 expect greater returns as compensation for that risk.

19 **Q. DOES THE FINANCIAL LITERATURE AFFIRM A RELATIONSHIP**
20 **BETWEEN SIZE AND COMMON EQUITY COST RATE?**

21 A. Yes. Brigham⁷ states:

22 A number of researchers have observed that portfolios of small-

⁷ Eugene F. Brigham, Fundamentals of Financial Management, Fifth Edition, The Dryden Press, 1989, p. 623.

1 firms have earned consistently higher average returns than those
2 of large-firms stocks; this is called "small-firm effect." On the
3 surface, it would seem to be advantageous to the small firms to
4 provide average returns in a stock market that are higher than
5 those of larger firms. In reality, it is bad news for the small firm;
6 what *the small-firm effect means is that the capital market*
7 *demands higher returns on stocks of small firms than on otherwise*
8 *similar stocks of the large firms.* (italics added)
9

10 V. FINANCIAL RISK

11 Q. PLEASE DEFINE FINANCIAL RISK AND EXPLAIN WHY IT IS IMPORTANT
12 TO THE DETERMINATION OF A FAIR RATE OF RETURN.

13 A. Financial risk is the additional risk created by the introduction of senior capital,
14 i.e., debt and preferred stock, into the capital structure. In other words, the
15 higher the proportion of senior capital in the capital structure, the higher the
16 financial risk.

17 Utilities formerly were considered to have much less business risk in
18 comparison to unregulated enterprises, and, as a result, a larger percentage of
19 debt capital was acceptable to investors. In June 2004, S&P revised its utility
20 financial guidelines and assigned new business profile scores to U.S. utility
21 companies to better reflect the relative business risk among companies in the
22 sector. S&P's revised financial guidelines for utilities can be found in Schedule
23 PMA-2, page 14, while pages 1 through 9 describe the utility bond rating
24 process. As shown on page 14, S&P's revised financial guidelines for utilities
25 establishes financial guideline ratios for ten levels of business position/profile
26 with "1" being considered lowest risk and "10" being highest risk.

27 As shown on Schedule PMA-10, page 2, the average S&P bond rating
28 (issuer credit rating) and business profile of the eight AUS Utility Reports water

1 companies is A+ (A) and “2.7”, which rounds to “3” and A+/A (A) and “2.7”
2 (rounded to “3”), for the four Value Line (Std. Ed.) water companies.

3 **Q. HOW CAN ONE MEASURE THE COMBINED BUSINESS RISKS, I.E.,**
4 **INVESTMENT RISK OF AN ENTERPRISE?**

5 A. Similar bond ratings/issue credit ratings reflect similar combined business risks,
6 i.e., total risk. Although the specific business or financial risks may differ
7 between companies, the same bond rating indicates that the combined risks
8 are similar as the bond rating process reflects acknowledgment of all
9 diversifiable business risks in order to assess credit quality or credit risk. For
10 example, S&P expressly states that the bond rating process encompasses a
11 qualitative analysis of business risks (see pages 3 through 9 of Schedule PMA-
12 2). While not a means by which one can specifically quantify the differential in
13 common equity risk between companies, the bond (credit) rating provides a
14 useful means to compare/differentiate investment risk between companies
15 because it is the result of a thorough and comprehensive analysis of all
16 diversifiable business risks, i.e., investment risk.

17 **VI. UTILITIES SERVICES OF SOUTH CAROLINA, INC.**

18 **Q. HAVE YOU REVIEWED THE FINANCIAL DATA FOR USSC?**

19 A. Yes. USSC provides water service on a combined basis to approximately
20 9,000 customers in Lexington, Richland, Sumter, Saluda, York, Lancaster,
21 Anderson and Abbeville and wastewater services to 28 customers in York.
22 USSC is a wholly-owned subsidiary of Utilities, Inc. which is the sole source of
23 USSC’s external capital.

VII. PROXY GROUPS

Q. PLEASE EXPLAIN HOW YOU CHOSE THE PROXY GROUP OF EIGHT AUS UTILITY REPORTS WATER COMPANIES.

A. The basis of selection for the proxy group of eight AUS Utility Reports water companies were those companies that meet the following criteria: 1) they are included in the Water Company Group of AUS Utility Reports (July 2007); 2) they have Value Line or Reuters consensus five-year EPS growth projections; and 3) they have more than 70% of their 2006 operating revenues derived from water operations. Eight companies met all of these criteria.

Q. PLEASE DESCRIBE SCHEDULE PMA-3.

A. Schedule PMA-3 contains comparative capitalization and financial statistics for the eight AUS Utility Reports water companies for the years 2002 through 2006. The schedule consists of three pages. Page 1 contains a summary of the comparative data for the years 2002-2006. Page 2 contains notes relevant to page 1, as well as the basis of selection and names of the individual companies in the proxy group. Page 3 contains the capital structure ratios based upon total permanent by company and on average for the years 2002-2006.

During the five-year period ending 2006, the historically achieved average earnings rate on book common equity for this group ranged between 9.59% in 2003 and 10.56% in 2002, and averaged 10.08%. The five-year period ending 2006 average common equity ratio based upon total investor-provided permanent capital was 47.19%, while the five-year average dividend payout ratio was 73.19%.

Coverage of interest charges, excluding all AFUDC from funds from operations for the years 2002-2006 ranged between 3.61 and 4.22 times and averaged 3.94 times during the period, while funds from operations relative to total debt ranged from 16.43% to 19.60% and averaged 18.01% for the period.

Q. PLEASE EXPLAIN HOW YOU CHOSE THE PROXY GROUP OF FOUR VALUE LINE WATER COMPANIES.

A. The basis of selection for the proxy group of four Value Line (Std. Ed.) water companies was to include those companies which are part of Value Line's (Std. Ed.) Water Utility Industry Group.

Q. PLEASE DESCRIBE SCHEDULE PMA-4.

A. Schedule PMA-4 contains comparative capitalization and financial statistics for the four Value Line (Std. Ed.) water companies for the years 2002 through 2006. The schedule consists of two pages. Page 1 contains a summary of the comparative data for the years 2002-2006. Page 2 contains notes relevant to page 1, as well as the basis of selection and names of the individual companies in the proxy group. Page 3 contains the capital structure ratios based upon total permanent capital by company and on average for the years 2002-2006.

During the five-year period ending 2006, the historically achieved average earnings rate on book common equity for this group ranged between 8.15% in 2006, and 10.91% in 2002, and averaged 9.16%. The five-year period ending 2006 average common equity ratio based upon total investor-provided permanent capital was 47.24%, while the five-year average dividend payout ratio was 67.19%.

Coverage of interest charges, excluding all AFUDC from funds from operations for the years 2002-2006 ranged between 3.67 and 4.40 times and averaged 4.00 times during the five-year period, while funds from operations relative to total debt ranged from 15.81% to 20.38% and averaged 18.53% during the five-year period.

VIII. COMMON EQUITY COST RATE MODELS

A. The Efficient Market Hypothesis (EMH)

Q. ARE THE COST OF COMMON EQUITY MODELS YOU USE MARKET-BASED MODELS, AND HENCE BASED UPON THE EMH?

A. Yes. The DCF model is market-based in that market prices are utilized in developing the dividend yield component of the model. The RPM is market-based in that the bond ratings and expected bond yields used in the application of the RPM reflect the market's assessment of risk. In addition, the use of betas to determine the equity risk premium also reflects the market's assessment of risk as betas are derived from regression analyses of market prices. The CAPM is market-based for many of the same reasons that the RPM is market-based i.e., the use of expected bond (Treasury bond) yields and betas. The CEM is market-based in that the process of selecting the comparable risk non-utility companies is based upon statistics which result from regression analyses of market prices. Therefore, all the cost of common equity models I utilize are market-based models, and hence based upon the EMH.

Q. PLEASE DESCRIBE THE CONCEPTUAL BASIS OF THE EMH.

A. The Efficient Market Hypothesis (EMH), which is the foundation of modern

1 investment theory, was pioneered by Eugene F. Fama⁸ in 1970. An efficient
2 market is one in which security prices reflect all relevant information all the time.
3 This implies that prices adjust instantaneously to new information, thus reflecting
4 the intrinsic fundamental economic value of a security.⁹

5 The essential components of the EMH are:

- 6
- 7 A. Investors are rational and invest in assets providing the
8 highest expected return given a particular level of risk.
9
- 10 B. Current market prices reflect all publicly available
11 information.
12
- 13 C. Returns are independent i.e., today's market returns are
14 unrelated to yesterday's returns.
15
- 16 D. Capital markets follow a random walk i.e., the probability
17 distribution of expected returns approximates a normal
18 distribution.
19

20 Brealey and Myers state:¹⁰

21
22 When economists say that the security market is 'efficient', they are
23 not talking about whether the filing is up to date or whether desktops
24 are tidy. They mean that information is widely and cheaply
25 available to investors and that all relevant and ascertainable
26 information is already reflected in security prices.
27

28 The three forms of the EMH are:

- 29
- 30 A. The "weak" form which asserts that all past market prices and data are
31 fully reflected in securities prices i.e., technical analysis cannot enable
32 an investor to "outperform the market".
33
- 34 B. The "semistrong" form which asserts that all publicly available
35 information is fully reflected in securities prices i.e., fundamental
36 analysis cannot enable an investor to "outperform the market".

⁸ Fama, Eugene F., "Efficient Capital Markets: A Review of Theory and Empirical Work". Journal of Finance, May 1970, pp. 383-417.

⁹ Morin, Roger A., New Regulatory Finance, Public Utility Reports, Inc., Arlington, VA, 2006, pp. 279-281.

¹⁰ Brealey, R.A. and Myers, S.C., Principles of Corporate Finance, McGraw-Hill Publications, Inc., 1996, pp. 323-324.

1
2 C. The "strong" form which asserts that all information, both public and
3 private, is fully reflected in securities prices i.e., even insider information
4 cannot enable an investor to "outperform the market".
5

6 The "semistrong" form of the EMH is generally held to be true because the
7 use of insider information often enables investors to "outperform the market" and
8 earn excessive returns. The generally-accepted "semistrong" form of the EMH
9 means that all perceived risks are taken into account by investors in the prices
10 they pay for securities. Investors are aware of all publicly-available information,
11 including bond ratings, discussions about companies by bond rating agencies
12 and investment analysts as well as the various cost of common equity
13 methodologies (models) discussed in the financial literature. In an attempt to
14 emulate investor behavior, this means that no single common equity cost rate
15 model should be relied upon in determining a cost rate of common equity and
16 that the results of multiple cost of common equity models should be taken into
17 account.

18 **Q. IS THERE SUPPORT IN THE ACADEMIC LITERATURE FOR THE NEED TO**
19 **RELY UPON MORE THAN ONE COST OF COMMON EQUITY MODEL IN**
20 **ARRIVING AT A RECOMMENDED COMMON EQUITY COST RATE RANGE?**

21 A. Yes. For example, Phillips¹¹ states:

22 Since regulation establishes a level of authorized earnings which, in
23 turn, implicitly influences dividends per share, *estimation of the*
24 *growth rate from such data is an inherently circular process. For*
25 *these reasons, the DCF model "suggests a degree of precision*
26 *which is in fact not present" and leaves "wide room for controversy*
27 *and argument about the level of k" [investors' capitalization or*

¹¹ Charles F. Phillips, Jr., The Regulation of Public Utilities-Theory and Practice, 1993, Public Utility Reports, Inc., Arlington, VA, p. 396, 398.

1 discount rate, i.e., the cost of capital]. (italics added) (p. 396)

2
3 * * *

4
5 Despite the difficulty of measuring relative risk, the comparable
6 earnings standard is no harder to apply than is the market-
7 determined standard. The DCF method, to illustrate, requires a
8 subjective determination of the growth rate the market is
9 contemplating. Moreover, as Leventhal has argued: '*Unless the*
10 *utility is permitted to earn a return comparable to that available*
11 *elsewhere on similar risk, it will not be able in the long run to attract*
12 *capital.*' (italics added) (p. 398)

13
14 Also, Morin¹² states:

15
16 Each methodology requires the exercise of considerable judgment
17 on the reasonableness of the assumptions underlying the
18 methodology and on the reasonableness of the proxies used to
19 validate a theory. *The inability of the DCF model to account for*
20 *changes in relative market valuation, discussed below, is a vivid*
21 *example of the potential shortcomings of the DCF model when*
22 *applied to a given company.* Similarly, the inability of the CAPM to
23 account for variables that affect security returns other than beta
24 tarnishes its use. (italics added)

25
26 No one individual method provides the necessary level of precision
27 for determining a fair return, but each method provides useful
28 evidence to facilitate the exercise of an informed judgment.
29 Reliance on any single method or preset formula is inappropriate
30 when dealing with investor expectations because of possible
31 measurement difficulties and vagaries in individual companies'
32 market data. (Morin, p. 428)

33
34 * * *

35
36 The financial literature supports the use of multiple methods.
37 Professor Eugene Brigham, a widely respected scholar and finance
38 academician, asserts:¹²(footnote omitted)

39
40 Three methods typically are used: (1) the Capital Asset Pricing
41 Model (CAPM), (2) the discounted cash flow (DCF) method, and
42 (3) the bond-yield-plus-risk-premium approach. These methods
43 are not mutually exclusive – no method dominates the others,
44 and all are subject to error when used in practice. Therefore,

¹² Id., at pp. 428 and 430 - 431.

1 when faced with the task of estimating a company's cost of
2 equity, we generally use all three methods and then choose
3 among them on the basis of our confidence in the data used for
4 each in the specific case at hand.

5
6 Another prominent finance scholar, Professor Stewart Myers, in an
7 early pioneering article on regulatory finance, stated.^{2(footnote omitted)}
8

9 Use more than one model when you can. Because estimating
10 the opportunity cost of capital is difficult, only a fool throws away
11 useful information. That means you should not use any one
12 model or measure mechanically and exclusively. Beta is helpful
13 as one tool in a kit, to be used in parallel with DCF models or
14 other techniques for interpreting capital market data.
15

16 Reliance on multiple tests recognizes that no single methodology
17 produces a precise definitive estimate of the cost of equity. As
18 stated in Bonbright, Danielsen, and Kamerschen (1988), '*no single*
19 *or group test or technique is conclusive.*' Only a fool discards
20 relevant evidence. (italics in original) (Morin, p. 430)
21

22 * * *

23
24 While it is certainly appropriate to use the DCF methodology to
25 estimate the cost of equity, there is no proof that the DCF produces
26 a more accurate estimate of the cost of equity than other
27 methodologies. Sole reliance on the DCF model ignores the capital
28 market evidence and financial theory formalized in the CAPM and
29 other risk premium methods. The DCF model is one of many tools
30 to be employed in conjunction with other methods to estimate the
31 cost of equity. *It is not a superior methodology that supplants other*
32 *financial theory and market evidence. The broad usage of the DCF*
33 *methodology in regulatory proceedings in contrast to its virtual*
34 *disappearance in academic textbooks does not make it superior to*
35 *other methods. The same is true of the Risk Premium and CAPM*
36 *methodologies.* (italics added) (Morin, p. 431)
37

38 In view of the foregoing, it is clear that investors are or should be aware of all of
39 the models available for use in determining a common equity cost rate. The
40 EMH requires the assumption that, collectively, investors consider them all.

1 **B. Discounted Cash Flow Model (DCF)**

2 **Q. WHAT IS THE THEORETICAL BASIS OF THE DCF MODEL?**

3 A. The theory of the DCF model is that the present value of an expected future
4 stream of net cash flows during the investment holding period can be determined
5 by discounting the cash flows at the cost of capital, or the capitalization rate.
6 DCF theory suggests that an investor buys a stock for an expected total return
7 rate which is expected to be derived from cash flows received in the form of
8 dividends plus appreciation in market price (the expected growth rate). Thus, the
9 dividend yield on market price plus a growth rate equals the capitalization rate,
10 i.e., the total return rate expected by investors.

11 **Q. PLEASE COMMENT ON THE APPLICABILITY OF THE DCF MODEL IN**
12 **ESTABLISHING A COST OF COMMON EQUITY FOR USSC.**

13 A. The extent to which the DCF is relied upon should depend upon the extent to
14 which the cost rate results differ from those resulting from the use of other cost of
15 common equity models because the DCF model has a tendency to mis-specify
16 investors' required return rate when the market value of common stock differs
17 significantly from its book value. Mathematically, because the "simplified" DCF
18 model traditionally used in rate regulation assumes a market-to-book ratio of one,
19 it understates/overstates investors' required return rate when market value
20 exceeds/is less than book value. It does so because, in many instances, market
21 prices reflect investors' assessments of long-range market price growth
22 potentials (consistent with the infinite investment horizon implicit in the standard
23 regulatory version of the DCF model) not fully reflected in analysts' shorter range

1 forecasts of future growth for earnings per share (EPS) and dividends per share
2 (DPS) accounting proxies. Thus, the market-based DCF model will result in a
3 total annual dollar return on book common equity equal to the total annual dollar
4 return expected by investors only when market and book values are equal, a rare
5 and unlikely situation. In recent years, the market values of utilities' common
6 stocks have been well in excess of their book values as shown on page 1 of
7 Schedule PMA-3 ranging between 220.24% and 268.90% for the proxy group of
8 eight AUS Utility Reports water companies and between 220.49% and 262.50%
9 for the proxy group of four Value Line (Std. Ed.) water companies as shown on
10 page 1 of Schedule PMA-4.

11 Roger A. Morin has confirmed this tendency of the DCF by stating¹³:

12 The third and perhaps most important reason for caution and
13 skepticism is that application of the DCF model produces estimates
14 of common equity cost that are consistent with investors' expected
15 return only when stock price and book value are reasonably similar,
16 that is when the M/B is close to unity. As shown below, application
17 of the standard DCF model to utility stocks understates the investor's
18 expected return when the market-to-book (M/B) ratio of a given stock
19 exceeds unity. This is particularly relevant in the capital market
20 environment of the 1990s and 2000s, where utility stocks are trading
21 at M/B ratios well above unity and have been for nearly two decades.
22 The converse is also true, that is, the DCF model overstates that
23 investor's return when the stock's M/B ratio is less than unity. The
24 reason for the distortion is that the DCF market return is applied to a
25 book value rate base by the regulator, that is, a utility's earnings are
26 limited to earnings on a book value rate base. (emphasis supplied)
27

28 Under the DCF model, the rate of return investors require is related to the
29 price paid for a security. Thus, market prices form the basis of investment
30 decisions and investors' expected rates of return. In contrast, a regulated utility
31 is limited to earning on its net book value (depreciated original cost) rate base.

1 Market values can diverge from book values for a myriad of reasons including,
2 but not limited to, earnings per share (EPS) and dividends per share (DPS)
3 expectations, merger / acquisition expectations, interest rates, etc. Thus, when
4 market values are grossly disparate from their book values, a market-based DCF
5 cost rate applied to the book value of common equity will not reflect investors'
6 expected common equity cost rate. It will either overstate the common equity
7 cost rate (without regard to any adjustment for flotation costs which may, at
8 times, be appropriate) when market value is less than book value or understate
9 the cost rate when market value is, as here, above book value.

10 This indicates the need to better match market prices with investors'
11 longer range growth expectations embedded in those prices. However, the
12 understatement/overstatement of investors' required return rate associated with
13 the application of the market price-based DCF model to the book value of
14 common equity clearly illustrates why reliance upon a single common equity cost
15 rate model should be avoided.

16 **Q. IS IT REASONABLE TO EXPECT THE MARKET VALUES OF UTILITIES'**
17 **COMMON STOCKS TO CONTINUE TO SELL WELL ABOVE THEIR BOOK**
18 **VALUES?**

19 A. Yes. I believe that the common stocks of utilities will continue to sell
20 substantially above their book values, because many investors, especially
21 individuals who traditionally committed less capital to the equity markets, will
22 likely continue to commit a greater percentage of their available capital to
23 common stocks in view of lower interest rate alternative investment opportunities

¹³ Id., at p. 434.

1 and to provide for retirement. The recent past and current capital market
2 environment is in stark contrast to the late 1970's and early 1980's when very
3 high (by historical standards) yields on secured debt instruments in public utilities
4 were available. Despite the fact that the market declined significantly during late
5 2001 through 2003, following the September 11, 2001 tragedy and despite
6 recent market volatility due to volatile energy prices, utility stocks have continued
7 to sell at market prices well above their book values. The significant recent
8 increases in market-to-book ratios have been influenced by factors other than
9 fundamentals such as actual and reported growth in earnings per share (EPS)
10 and dividends per share (DPS).

11 Traditional rate base/rate of return regulation, where a market-based
12 common equity cost rate is applied to a book value rate base, presumes that
13 market-to-book ratios are one. However, there is ample empirical evidence over
14 sustained periods which demonstrate that this is an incorrect presumption.
15 Market-to-book ratios of one are rarely the case as there are many factors
16 affecting the market price of common stocks, in addition to earnings. Moreover,
17 allowed ROEs have a limited effect on utilities' market/book ratios as market
18 prices of common stocks are influenced by a number of other factors beyond the
19 direct influence of the regulatory process.

20 For example, Phillips¹⁴ states:

21 Many question the assumption that market price should equal book
22 value, believing that 'the earnings of utilities should be sufficiently
23 high to achieve market-to-book ratios which are consistent with
24 those prevailing for stocks of unregulated companies.'

¹⁴ Id., at p. 395.

1
2 In addition, Bonbright¹⁵ states:
3

4 In the first place, commissions cannot forecast, except within wide
5 limits, the effect their rate orders will have on the market prices of
6 the stocks of the companies they regulate. In the second place,
7 *whatever the initial market prices may be, they are sure to change*
8 *not only with the changing prospects for earnings, but with the*
9 *changing outlook of an inherently volatile stock market.* In short,
10 market prices are beyond the control, though not beyond the
11 influence of rate regulation. Moreover, even if a commission did
12 possess the power of control, any attempt to exercise it ... would
13 result in harmful, uneconomic shifts in public utility rate levels.
14 (italics added)
15

16 In view of the foregoing, a mismatch results in the application of the DCF
17 model as market prices reflect long range expectations of growth in market
18 prices (consistent with the presumed infinite investment horizon of the standard
19 DCF model), while the short range forecasts of growth in accounting proxies, i.e.,
20 EPS and DPS, do not reflect the full measure of growth (market price
21 appreciation) expected in per share market value.

22 **Q. HAVE ANY COMMISSIONS RECOGNIZED THIS TENDENCY OF THE DCF**
23 **MODEL TO UNDERSTATE/OVERSTATE INVESTORS' REQUIRED RETURN**
24 **RATE WHEN MARKET-TO-BOOK RATIOS ARE GREATER/LESS THAN**
25 **UNITY?**

26 A. Yes. The Pennsylvania Public Utility Commission recognized this tendency in its
27 order of August 26, 2006 in Docket No. R-00049862, et al re: The City of
28 Lancaster – Sewer Fund when it stated:

¹⁵ James C. Bonbright, Albert L. Danielsen and David R. Kamerschen, Principles of Public Utility Rates, 1988, Public Utilities Reports, Inc., Arlington, VA, p. 334.

1 The ALJ recommended a market-to-book adjustment (MTB) of 65
2 basis points (.65%) to her recommended equity return. The ALJ
3 reasoned that this adjustment had been adopted by the Commission
4 in three major rate cases in the past 18 months. See *Pa. P.U.C. v.*
5 *PPL Electric Utilities Corporation*, 2004 Pa. P.U.C. LEXIS 40; *Pa.*
6 *P.U.C. (PPL) Pa. PUC v. Aqua Pennsylvania, Inc.*, R-00038805,
7 (Order entered August 5, 1004) (*Aqua*); and *Pa. P.U.C.V.*
8 *Pennsylvania-American Water Company*, Docket No. R-00038304
9 (Order entered January 29, 204) (*PAWC*)

10
11 * * * *

12
13 As discussed previously herein, the ALJ recommended a MTB
14 adjustment of 65 basis points to her unadjusted DCF starting point of
15 10.1 percent. We shall adopt this adjustment. First, this adjustment
16 is consistent with our recent orders in *PAWC*, *Aqua*, and *PPL*. Next,
17 we note that *Aqua* and *PAWC* are subsidiaries of corporate parents
18 which are publicly traded. The actual utilities operating in
19 Pennsylvania are not publicly traded. Nevertheless, we applied the
20 adjustment to the entities which are providing service in
21 Pennsylvania. Thus, we reject the argument advanced by the OTS
22 in its Exceptions that this adjustment is inappropriate because the
23 City's operation is not an investor-owned utility. As in *PPL*, we find
24 that adjustment is necessary because the DCF method produces the
25 investor required return based on the current market price, not the
26 return on the book value capitalization. With the MTB adjustment,
27 the equity return allowance is 10.75 percent. (emphasis added)
28

29 **Q. PLEASE EXPLAIN WHY A DCF-DERIVED COMMON EQUITY COST RATE**
30 **MIS-SPECIFIES INVESTORS' EXPECTED COMMON EQUITY COST RATE**
31 **WHEN THE MARKET/BOOK RATIO IS GREATER OR LESS THAN UNITY**
32 **(100%).**

33 A. Under the DCF model, the rate of return investors require is related to the price
34 paid for a stock i.e., market price is the basis upon which they formulate the
35 required rate of return. A regulated utility is limited to earning on its net book
36 value (depreciated original cost) rate base. As discussed previously, market
37 values differ from book values for many reasons unrelated to earnings. Thus,

1 when market values differ significantly from book values, a market-based DCF
2 cost rate applied to the book value of common equity will not accurately reflect
3 investors' expected common equity cost rate. It will either overstate or
4 understate investors' expected common equity cost rate (without regard to any
5 adjustment for flotation costs which may, at times, be appropriate on an ad hoc
6 basis) depending upon whether market value is less than or greater than book
7 value.

8 Schedule PMA-5 demonstrates how a market-based DCF cost rate
9 applied to a book value which is either below or above market value will either
10 understate or overstate investors' expectations because these expectations are
11 based on a required return on market value. As shown, there is no realistic
12 opportunity to earn the market-based rate of return on book value. Note that in
13 Column 1, investors expect a 10.00% return on a market price of \$24.00.
14 Moreover, as shown in Column 2, when the 10.00% return rate on market value
15 is applied to book value which is approximately 55.5% of market value, the total
16 annual return opportunity is just \$1.333 on book value. With an annual dividend
17 of \$0.840, there is an opportunity for growth of \$0.493 which translates to just
18 2.05% in contrast to the 6.50% growth in market price expected by investors.
19 There is no way to possibly achieve the expected growth of \$1.560 or 6.50%
20 absent a huge cut in the annual dividend, an unreasonable expectation which
21 would result in an extremely adverse reaction by investors because it would be a
22 sign of extreme financial distress.

23 Conversely, in Column 3, where the market-to-book ratio is 80%, when the

1 10.00% return rate on market value is applied to a book value which is
2 approximately 25.0% greater than market value, the total annual return
3 opportunity is \$3.000 on book value with an annual dividend of \$0.840, there is
4 an opportunity for growth of \$2.160 which translates to 9.00% in contrast to the
5 6.50% growth in market price expected by investors.

6 In view of the foregoing, it is clear that the DCF model either understates
7 or overstates investors' required cost of common equity capital when market
8 values exceed or are less than their underlying book values and thus multiple
9 cost of common equity models should be relied upon when estimating investors'
10 expectations.

11 **Q. HAVE ANY COMMISSIONS EXPLICITLY STATED THAT THE DCF MODEL**
12 **SHOULD NOT BE RELIED UPON EXCLUSIVELY?**

13 A. Yes. As stated previously, the majority of regulatory commissions rely upon a
14 combination of the various cost of common equity models available.

15 Specifically, the Iowa Utilities Board (IUB) has recognized the tendency of
16 the DCF model to understate investors' expected cost of common equity capital
17 when market values are significantly above their book values. In its June 17,
18 1994 Final Decision and Order in Re U.S. West Communications, Docket No.
19 RPU-93-9 the IUB stated:¹⁶

20 While the Board has relied in the past on the DCF model, in *Iowa*
21 *Electric Light and Power Company*, Docket No. RPU-89-9, "Final
22 Decision and Order" (October 15, 1990), the Board stated: "[T]he
23 DCF model may understate the return on equity in some
24 circumstances. This is particularly true when the market is
25 relatively volatile and the company in question has a market-to-

¹⁶

Re: U.S. West Communications, Inc., Docket No. RPU-93-9, 152 PUR4th at 459.

1 book ratio in excess of one." Those conditions exist in this case
2 and the Board will not rely on the DCF return. (Consumer
3 Advocate Ex. 367, See Tr. 2208, 2250, 2277, 2283-2284). *The*
4 *DCF approach underestimates the cost of equity needed to assure*
5 *capital attraction during this time of market uncertainty and*
6 *volatility. The board will, therefore, give preference to the risk*
7 *premium approach.* (italics added)
8

9 Similarly, in 1994, the Indiana Utility Regulatory Commission (IURC), for
10 example, recognized the tendency of the DCF model to understate the cost of
11 equity when market value exceeds book value¹⁷:

12 In determining a common equity cost rate, we must again
13 recognize the tendency of the traditional DCF model, . . . to
14 understate the cost of common equity. As the Commission stated
15 in Indiana-Mich. Power Co. (IURC 8/24/90), Cause No. 38728, 116
16 PUR 4th 1, 17-18, *"the unadjusted DCF result is almost always well*
17 *below what any informed financial analyst would regard as*
18 *defensible, and therefore, requires an upward adjustment based*
19 *largely on the expert witness's judgement."* (italics added)
20

21 * * *

22
23 [u]nder the traditional DCF model . . . the appropriate earnings level
24 of the utility would not be derived by applying the DCF result to the
25 market price of the Company's stock . . . it would be applied to the
26 utility's net original cost rate base. *If the market price of the stock*
27 *exceeds its book value, . . . the investor will not achieve the return*
28 *which the model finds is necessary.* (italics added)
29

30 Also, the Hawaii Public Utilities Commission (HPUC) recognized this
31 phenomenon in a decision dated June 30, 1992¹⁸ in a case regarding Hawaiian
32 Electric Company, Inc., when it stated:

33 In this docket, as in other rate proceedings, experts disagree on the
34 relative merits of the various methods of determining the cost of
35 common equity. In this docket, HECO is particularly critical of the

¹⁷ Re: Indiana-American Water Company, Inc., Cause No. 39595, 150 PUR4th at 167-168.

¹⁸ Re: Hawaiian Electric Company, Inc., Docket No. 6998, 134 PUR4th at 479.

1 use of the constant growth DCF methodology. It asserts that
2 method is imbued with downward bias and, thus, its use will
3 understate common equity cost. *We are cognizant of the*
4 *shortcomings of the DCF method.* There are, however,
5 shortcomings to be found with the use of CAPM and the RP
6 methods as well. We reiterate that, despite the problems with the
7 use of any methodology, *all methods should be considered and*
8 *that the DCF method and the combined CAPM and RP methods*
9 *should be given equal weight.* (italics added)
10

11 **Q. DO OTHER COST OF COMMON EQUITY MODELS CONTAIN UNREALISTIC**
12 **ASSUMPTIONS AND HAVE SHORTCOMINGS?**

13 A. Yes. That is why I am not recommending that any of the models be relied upon
14 exclusively. I have focused on the shortcomings of the DCF model because
15 some regulatory commissions still place excessive or exclusive reliance upon it.
16 Although the DCF model is useful, it is not a superior methodology that supplants
17 financial theory and market evidence based upon other valid cost of common
18 equity models. For these reasons, no model, including the DCF, should be relied
19 upon exclusively.

20 **Q. PLEASE DESCRIBE THE DIVIDEND YIELD YOU USED IN YOUR**
21 **APPLICATION OF THE DCF MODEL.**

22 A. The unadjusted dividend yields are based upon an average of a recent spot date
23 (July 10, 2007) as well as an average of the three months ended June 30, 2007,
24 respectively, which is derived on Schedule PMA-7. The average unadjusted
25 yield is 2.9% for the eight AUS Utility Reports water companies and 2.5% for the
26 four Value Line (Std. Ed.) water companies.

27 **Q. PLEASE EXPLAIN THE DIVIDEND GROWTH COMPONENT SHOWN ON**
28 **SCHEDULE PMA-6, PAGE 1, COLUMN 2.**

1 A. Because dividends are paid quarterly, or periodically, as opposed to continuously
2 (daily), an adjustment to the dividend yield must be made. This is often referred
3 to as the discrete, or the Gordon Periodic, version of the DCF model.

4 Since the various companies in the proxy groups increase their quarterly
5 dividend at various times during the year, a reasonable assumption is to reflect
6 one-half the annual dividend growth rate in the D_1 expression, or $D_{1/2}$. This is a
7 conservative approach which does not overstate the dividend yield which should
8 be representative of the next twelve-month period. Therefore, the actual
9 average dividend yields in Column 1 on Schedule PMA-6 have been adjusted
10 upward to reflect one-half the growth rates shown in Column 4.

11 **Q. PLEASE EXPLAIN THE BASIS OF THE GROWTH RATES OF THE PROXY**
12 **GROUP OF EIGHT AUS UTILITY REPORTS WATER COMPANIES AND THE**
13 **PROXY GROUP OF FOUR VALUE LINE (STD. ED.) WATER COMPANIES**
14 **WHICH YOU USE IN YOUR APPLICATION OF THE DCF MODEL.**

15 A. Schedule PMA-8 indicates that approximately 68% of the common shares of the
16 proxy group of eight AUS Utility Reports water companies and 52% of the
17 common shares of the proxy group of four Value Line (Std. Ed.) water
18 companies are held by individuals as opposed to institutional investors.
19 Individual investors are particularly likely to place great significance on the
20 opinions expressed by financial information services, such as Value Line and
21 Reuters, which are easily accessible and/or available on the Internet.

22 Forecasts by analysts, including Value Line, are typically limited to five
23 years. In my opinion, investors in water utilities would have little interest in

1 historical growth rates beyond the most recent five years because an historical
2 five-year period balances the five-year period for projected growth rates.
3 Consequently, the use of five-year historical and five-year projected growth rates
4 in earnings per share (EPS) and dividends per share (DPS) as well as the sum
5 of internal and external growth in per share value (BR + SV) is appropriate to
6 consider in the determination of a growth rate for use in this application of the
7 DCF model. In addition, investors realize that analysts have significant insight
8 into the dynamics of the industries and they analyze individual companies as well
9 as companies' abilities to effectively manage the effects of changing laws and
10 regulations. Consequently, I have reviewed analysts' projected growth in EPS,
11 as well as historical and projected five-year compound growth rates in EPS, DPS
12 and (BR + SV) for each company in each proxy group. The historical growth
13 rates are from Value Line or are calculated in a manner similar to Value Line,
14 while the projected growth rates in earnings are from Value Line and Reuters
15 forecasts. Reuters growth rate estimates are not available for DPS and internal
16 growth, and they do not include the Value Line projections.

17 In addition to evaluating EPS and DPS growth rates, it is reasonable to
18 assume that investors also assess (BR + SV). The concept is based on well
19 documented financial theory that future dividend growth is a function of the
20 portion of the overall return to investors which is reinvested in the firm plus the
21 sales of new common stock. Consequently, the growth component as proxied
22 by internal and external growth is defined as follows:

1
$$g = BR + SV$$

2
3 Where:

4
5 B = the fraction of earnings retained by the firm,
6 i.e., retention ratio

7 R = the return on common equity

8
9 S = the growth in common shares outstanding

10
11 V = the premium/discount of a company's stock price
12 relative to its book value, i.e., one minus the
13 complement of the market/book ratio.
14

15 Consistent with the use of five-year historical and five-year projected
16 growth rates in EPS and DPS, I have derived five-year historical and five-year
17 projected (BR + SV) growth. Projected EPS growth rate averages are shown in
18 Column 4 on the lower half of Schedule PMA-6, while historical and projected
19 growth rates in DPS, EPS, and BR + SV are shown in Column 4 on the upper
20 half of Schedule PMA-6. The bases of these growth rates are summarized for
21 the companies in each proxy group on page 1, Schedule PMA-9. Supporting
22 growth rate data are detailed on pages 2 through 7 of Schedule PMA-9, while
23 pages 8 through 15 contain all of the most current Value Line Investment
24 Survey data for the companies in both proxy groups.

25 **Q. PLEASE SUMMARIZE THE GROWTH DCF MODEL RESULTS.**

26 A. As shown on Schedule PMA-6, the results of the applications of the DCF
27 model are 9.8% for the proxy group of eight AUS Utility Reports water
28 companies and 10.1% for the proxy group of four Value Line (Std. Ed.) water
29 companies. In arriving at conclusions of indicated common equity cost rates
30 for the two proxy groups, I included only those DCF results which are greater

1 than 8.6%, i.e., 200 basis points above the average prospective yield on
2 Moody's A rated public utility bonds of 6.6% based upon Blue Chip Financial
3 Forecasts' July 1, 2007 consensus forecast of about 50 economists of the
4 expected yield on Aaa rated corporate bonds as discussed subsequently and
5 derived in Note 3 on page 6 of Schedule PMA-10. As will also be discussed
6 subsequently, it is necessary to adjust the average Aaa rated corporate bond
7 yield to be equivalent to a Moody's A2 rated public utility bond. Thus, an
8 adjustment to the average prospective yield on Aaa rated corporate bonds of
9 0.5% was required, as detailed in Note 2 on page 1 of Schedule PMA-10,
10 resulting in an average prospective yield on Moody's A rated public utility bonds
11 of 6.6%.

12 Based upon a review of recent authorized returns on common equity
13 (ROE) throughout the United States relative to concurrent estimates of the
14 average yield on A rated public utility bonds, I determined that the equity risk
15 premium implicit in authorized ROEs in fully litigated cases for the twelve
16 months ended June 30, 2007 ranged between 318 and 545 basis points and
17 averaged 442 basis points as shown on Schedule PMA-13. In accordance with
18 the EMH, investors are aware of these implicit equity risk premia and, in my
19 opinion, would not consider returns providing an equity risk premium of only
20 200 basis points either reasonable or credible. Therefore, it is reasonable, if
21 not conservative, to eliminate any DCF results which are no more than 200
22 basis points above the current prospective average yield on A rated public
23 utility bonds of 6.6%.

1 In view of the foregoing, as shown on Schedule PMA-6, the results of
2 the applications of the DCF model are 9.8% for the proxy group of eight AUS
3 Utility Reports water companies and 10.1% for the proxy group of four Value
4 Line (Std. Ed.) water companies.

5 **C. The Risk Premium Model (RPM)**

6 **Q. PLEASE DESCRIBE THE THEORETICAL BASIS OF THE RPM.**

7 A. Risk Premium theory indicates that the cost of common equity capital is greater
8 than the prospective company-specific cost rate for long-term debt capital. In
9 other words, the cost of common equity equals the expected cost rate for long-
10 term debt capital plus a risk premium to compensate common shareholders for
11 the added risk of being unsecured and last-in-line for any claim on the
12 corporation's assets and earnings.

13 **Q. SOME ANALYSTS STATE THAT THE RPM IS ANOTHER FORM OF THE**
14 **CAPM. DO YOU AGREE?**

15 A. While there are some similarities, there is a very significant distinction between
16 the two models. The RPM and CAPM both add a "risk premium" to an interest
17 rate. However, the beta approach to the determination of an equity risk
18 premium in the RPM should not be confused with the CAPM. Beta is a
19 measure of systematic, or market, risk, a relatively small percentage of total
20 risk (the sum of both non-diversifiable systematic and diversifiable
21 unsystematic risk). Unsystematic risk is fully captured in the RPM through the
22 use of the prospective long-term bond yield as can be shown by reference to
23 pages 3 through 9 of Schedule PMA-2, which confirm that the bond rating

1 process involves an assessment of all business risks. In contrast, the use of a
2 risk-free rate of return in the CAPM does not, and by definition cannot, reflect a
3 company's specific i.e., unsystematic risk. Consequently, a much larger portion
4 of the total common equity cost rate is reflected in the company-specific bond
5 yield (a product of the bond rating) than is reflected in the risk-free rate in the
6 CAPM, or indeed even by the dividend yield employed in the DCF model.
7 Moreover, the financial literature recognizes the RPM and CAPM as two
8 separate and distinct cost of common equity models as discussed previously.

9 **Q. HAVE YOU PERFORMED RPM ANALYSES OF COMMON EQUITY COST**
10 **RATE FOR THE TWO PROXY GROUPS?**

11 A. Yes. The results of my application of the RPM are summarized on page 1 of
12 Schedule PMA-10. The first step is to determine the expected bond yield.

13 **Q. PLEASE EXPLAIN THE BASIS OF THE EXPECTED BOND YIELD OF 6.2%**
14 **APPLICABLE TO THE AVERAGE COMPANY IN BOTH PROXY GROUPS.**

15 A. Because the cost of common equity is prospective, a prospective yield on
16 similarly-rated long-term debt is essential. As shown on Schedule PMA-10,
17 page 2, the average Moody's bond rating of both proxy groups is A2. I relied
18 upon a consensus forecast of about 50 economists of the expected yield on
19 Aaa rated corporate bonds for the six calendar quarters ending with the fourth
20 calendar quarter of 2008 as derived from the July 1, 2007 Blue Chip Financial
21 Forecasts (shown on page 7 of Schedule PMA-10). As shown on Line No. 1 of
22 page 1 of Schedule PMA-10, the average expected yield on Moody's Aaa rated
23 corporate bonds is 6.1%. It is necessary to adjust that average yield to be

1 equivalent to a Moody's A2 rated public utility bond. Consequently, an
2 adjustment to the average prospective yield on Aaa rated corporate bonds of
3 0.5% was required. It is shown on Line No. 2, page 1 of Schedule PMA-10 and
4 explained in Note 2 at the bottom of the page. After adjustment, the expected
5 bond yield applicable to a Moody's A rated public utility bond is 6.6% as shown
6 on Line No. 3, page 1 of Schedule PMA-10.

7 Because both the proxy group of eight AUS Utility Reports water
8 companies' and the proxy group of four Value Line (Std. Ed.) water companies'
9 average Moody's bond rating is A2, no adjustment is necessary to make the
10 prospective bond yield applicable to an A2 public utility bond. Therefore, the
11 expected specific bond yield is 6.6% for both proxy groups of water companies.

12 **Q. PLEASE EXPLAIN THE METHOD UTILIZED TO ESTIMATE THE EQUITY**
13 **RISK PREMIUM.**

14 A. I evaluated the results of two different historical equity risk premium studies, as
15 well as Value Line's forecasted total annual market return in excess of the
16 prospective yield on high grade corporate bonds, as detailed on pages 5, 6 and
17 8 of Schedule PMA-10. As shown on Line No. 3, page 5 of Schedule PMA-10,
18 the mean equity risk premium based on both of the studies is 4.2% applicable
19 to the proxy group of eight AUS Utility Reports water companies and 4.4%
20 applicable to the proxy group of four Value Line (Std. Ed.) water companies.
21 These estimates are the result of an average of a beta-derived historical equity
22 risk premium and a forecasted total market equity risk premium as well as the
23 mean historical equity risk premium applicable to public utilities with bonds

1 rated A based upon holding period returns.

2 The basis of the beta-derived equity risk premia applicable to the proxy
3 groups is shown on page 6 of Schedule PMA-10. Beta-determined equity risk
4 premia should receive substantial weight because betas are derived from the
5 market prices of common stocks over a recent five-year period. Beta is a
6 meaningful measure of prospective relative risk to the market as a whole and is
7 a logical means by which to allocate a relative share of the market's total equity
8 risk premium.

9 The total market equity risk premium utilized is 5.0% and is based upon
10 an average of both the long-term historical and forecasted market risk premia
11 of 6.2% and 3.7%, respectively, as shown on page 6 of Schedule PMA-10. To
12 derive the historical market equity risk premium, I used the most recent
13 Ibbotson Associates' data on holding period returns for the S&P 500
14 Composite Index and the average historical yield on Moody's Aaa and A rated
15 corporate bonds for the period 1926-2006. The use of holding period returns
16 over a very long period of time is useful in the beta approach. As the 2007
17 Yearbook - Valuation Edition states¹⁹:

18 The estimate of the equity risk premium depends on the length
19 of the data series studied. A proper estimate of the equity risk
20 premium requires a data series long enough to give a reliable
21 average without being unduly influenced by very good and very
22 poor short-term returns. When calculated using a long data
23 series, the historical equity risk premium is relatively stable.⁵
24 Furthermore, because an average of the realized equity risk
25 premium is quite volatile when calculated using a short history,
26 using a long series makes it less likely that the analyst can

¹⁹ 2007 Yearbook – Valuation Edition, Morningstar, Inc., 2007, pp. 82-83. Morningstar, Inc. acquired Ibbotson Associates in 2006.

1 justify any number he or she wants. The magnitude of how
2 shorter periods can affect the result will be explored later in this
3 chapter.

4
5 Some analysts estimate the expected equity risk premium using
6 a shorter, more recent time period on the basis that recent
7 events are more likely to be repeated in the near future;
8 furthermore, they believe that the 1920s, 1930s and 1940s
9 contain too many unusual events. This view is suspect because
10 all periods contain "unusual" events. Some of the most unusual
11 events this century took place quite recently, including the
12 inflation of the late 1970s and early 1980s, the October 1987
13 stock market crash, the collapse of the high-yield bond market,
14 the major contraction and consolidation of the thrift industry, the
15 collapse of the Soviet Union, the development of the European
16 Economic Community, and the attacks of September 11, 2001.

17
18 It is even difficult for economists to predict the economic
19 environment of the future. For example, if one were analyzing
20 the stock market in 1987 before the crash, it would be
21 statistically improbable to predict the impending short-term
22 volatility without considering the stock market crash and market
23 volatility of the 1929-1931 period.

24
25 Without an appreciation of the 1920s and 1930s, no one would
26 believe that such events could happen. The 81-year period
27 starting with 1926 is representative of what can happen: it
28 includes high and low returns, volatile and quiet markets, war
29 and peace, inflation and deflation, and prosperity and
30 depression. Restricting attention to a shorter historical period
31 underestimates the amount of change that could occur in a long
32 future period. Finally, because historical event-types (not
33 specific events) tend to repeat themselves, long-run capital
34 market return studies can reveal a great deal about the future.
35 Investors probably expect "unusual" events to occur from time
36 to time, and their return expectations reflect this. (footnote
37 omitted)

38
39 In addition, the use of long-term data in a RPM model is consistent with
40 the long-term investment horizon presumed by the DCF model. Consequently,
41 the long-term arithmetic mean total return rates on the market as a whole of
42 12.3% and the long-term arithmetic mean yield on corporate bonds of 6.1%

1 were used, as shown at Line Nos. 1 and 2 of page 6 of Schedule PMA-10. As
2 shown on Line No. 3 of page 6, the resultant long-term historical equity risk
3 premium on the market as a whole is 6.2%.

4 I used arithmetic mean return rates because they are appropriate for
5 cost of capital purposes. As stated in the 2007 Yearbook - Valuation Edition²⁰:

6 The equity risk premium data presented in this book are
7 arithmetic average risk premia as opposed to geometric average
8 risk premia. The arithmetic average equity risk premium can be
9 demonstrated to be most appropriate when discounting future
10 cash flows. For use as the expected equity risk premium in
11 either the CAPM or the building block approach, the arithmetic
12 mean or the simple difference of the arithmetic means of stock
13 market returns and riskless rates is the relevant number. This is
14 because both the CAPM and the building block approach are
15 additive models, in which the cost of capital is the sum of its
16 parts. The geometric average is more appropriate for reporting
17 past performance, since it represents the compound average
18 return.

19
20 The argument for using the arithmetic average is quite
21 straightforward. In looking at projected cash flows, the equity
22 risk premium that should be employed is the equity risk premium
23 that is expected to actually be incurred over the future time
24 periods. Graph 5-3 shows the realized equity risk premium for
25 each year based on the returns of the S&P 500 and the income
26 return on long-term government bonds. (The actual, observed
27 difference between the return on the stock market and the
28 riskless rate is known as the realized equity risk premium.)
29 There is considerable volatility in the year-by-year statistics. At
30 times the realized equity risk premium is even negative.

31
32 As Ibbotson Associates²¹ states in their 1999 Yearbook:

33
34 The expected equity risk premium should always be calculated
35 using the arithmetic mean. The arithmetic mean is the rate of
36 return which, when compounded over multiple periods, gives
37 the mean of the probability distribution of ending wealth
38 values....Stated another way, the arithmetic mean is correct

²⁰ Id., p. 77.

²¹ Ibbotson Associates, Stocks, Bonds, Bills and Inflation - 1999 Yearbook, pp. 157-158.

1 because an investment with uncertain returns will have a higher
2 expected ending wealth value than an investment which earns,
3 with certainty, its compound or geometric rate of return every
4 year....*Therefore, in the investment markets, where returns are*
5 *described by a probability distribution, the arithmetic mean is*
6 *the measure that accounts for uncertainty, and is the*
7 *appropriate one for estimating discount rates and the cost of*
8 *capital.* (italics added)
9

10 Ex-post (historical) total returns and equity risk premium spreads differ
11 in size and direction over time. This is precisely why the arithmetic mean is
12 important as it provides insight into the variance and standard deviation of
13 returns. This prospect for variance, as captured in the arithmetic mean,
14 provides the valuable insight needed by investors to estimate future risk when
15 making a current investment. Absent such valuable insight into the potential
16 variance of returns, investors cannot meaningfully evaluate prospective risk.
17 As discussed previously, all of the cost of common equity models, including the
18 DCF, are premised upon the EMH, that all publicly available information is
19 reflected in the market prices paid. If investors relied upon the geometric mean
20 of ex-post spreads, they would have no insight into the potential variance of
21 future returns because the geometric mean relates the change over many
22 periods to a constant rate of change, thereby obviating the year-to-year
23 fluctuations, or variance, critical to risk analysis.

24 The basis of the forecasted market equity risk premium can be found
25 on Line Nos. 4 through 6 on page 6 of Schedule PMA-10. It is derived from an
26 average of the most recent 3-month (using the months of April 2007 through
27 June 2007) and a recent spot (July 13, 2007) median market price appreciation
28 potentials by Value Line as explained in detail in Note 1 on page 3 of Schedule

1 PMA-11. The average expected price appreciation is 37% which translates to
2 8.19% per annum and, when added to the average (similarly calculated)
3 dividend yield of 1.62% equates to a forecasted annual total return rate on the
4 market as a whole of 9.8%. Thus, this methodology is consistent with the use
5 of the 3-month and spot dividend yields in my application of the DCF model.
6 To derive the forecasted total market equity risk premium of 3.7% shown on
7 Schedule PMA-10, page 6, Line No. 6, the July 1, 2007 forecast of about 50
8 economists of the expected yield on Moody's Aaa rated corporate bonds for
9 the six calendar quarters ending with the second calendar quarter 2008 of
10 6.1% from Blue Chip Financial Forecasts was deducted from the Value Line
11 total market return of 9.8%. The calculation resulted in an expected market
12 risk premium of 3.7%.

13 The average of the historical and projected market equity risk premia of
14 6.2% and 3.7% is 4.95%, rounded to 5.0%.

15 On page 9 of Schedule PMA-10, the most current Value Line (Standard
16 Edition) betas for the companies in the two proxy groups are shown. Applying
17 the average beta of each proxy group to the average market equity risk
18 premium of 5.0% results in a beta adjusted equity risk premium of 4.0% for the
19 proxy group of eight AUS Utility Reports water companies and 4.4% for the
20 proxy group of four Value Line (Std. Ed.) water companies as shown on
21 Schedule PMA-10, page 6, Line No. 9.

22 A mean equity risk premium of 4.4% applicable to companies with A
23 rated public utility bonds was calculated based upon holding period returns

1 from a study using public utilities, as shown on Line No. 2, page 5 of Schedule
2 PMA-10, and detailed on page 8 of the same schedule.

3 The equity risk premia applicable to the proxy group of eight AUS Utility
4 Reports water companies and the proxy group of four Value Line (Std. Ed.)
5 water companies are the averages of the beta-derived premia and that based
6 upon the holding period returns of public utilities with A rated bonds, as
7 summarized on Schedule PMA-10, page 5, i.e., 4.2% and 4.4%.

8 **Q. WHAT ARE THE RPM CALCULATED COMMON EQUITY COST RATES?**

9 A. They are 10.8% for the eight AUS Utility Reports water companies and 11.0%
10 for the four Value Line (Std. Ed.) water companies as shown on Schedule
11 PMA-10, page 1.

12 **Q. SOME CRITICS OF THE RPM MODEL CLAIM THAT ITS WEAKNESS IS**
13 **THAT IT PRESUMES A CONSTANT EQUITY RISK PREMIUM. IS SUCH A**
14 **CLAIM VALID?**

15 A. No. The equity risk premium varies inversely with interest rate changes,
16 although not in tandem with those changes. This presumption of a constant
17 equity risk premium is no different than the presumption of a constant "g", or
18 growth component, in the DCF model. If one calculates a DCF cost rate today,
19 the absolute result "k", as well as the growth component "g", would invariably
20 differ from a calculation made just one or several months earlier. This implies
21 that the "g" does change, although in the application of the standard DCF
22 model, the "g" is presumed to be constant. Hence, there is no difference
23 between the RPM and DCF models in that both models assume a constant

1 component, but in reality, these components, the "g" and the equity risk
2 premium both change.

3 As Morin²² states with respect to the DCF model:

4 It is not necessary that *g* be constant year after year to make
5 the model valid. *The growth rate may vary randomly around*
6 *some average expected value. Random variations around*
7 *trend are perfectly acceptable, as long as the mean expected*
8 *growth is constant.* The growth rate must be 'expectationally
9 constant' to use formal statistical jargon. (italics added)

10
11 The foregoing confirms that the RPM is similar to the DCF model. Both
12 assume an "expectationally constant" risk premium and growth rate,
13 respectively, but in reality both vary (change) randomly around an arithmetic
14 mean. Consequently, the use of the arithmetic mean, and not the geometric
15 mean is confirmed as appropriate in the determination of an equity risk
16 premium as discussed previously.

17 **D. The Capital Asset Pricing Model (CAPM)**

18 **Q. PLEASE EXPLAIN THE THEORETICAL BASIS OF THE CAPM.**

19 A. CAPM theory defines risk as the covariability of a security's returns with the
20 market's returns. This covariability is measured by beta (" β "), an index
21 measure of an individual security's variability relative to the market. A beta less
22 than 1.0 indicates lower variability while a beta greater than 1.0 indicates
23 greater variability than the market.

24 The CAPM assumes that all other risk, i.e., all non-market or
25 unsystematic risk, can be eliminated through diversification. The risk that
26 cannot be eliminated through diversification is called market, or systematic,

22 Id., p. 256.

1 risk. The CAPM presumes that investors require compensation for risks that
2 cannot be eliminated through diversification. Systematic risks are caused by
3 macroeconomic and other events that affect the returns on all assets.
4 Essentially, the model is applied by adding a risk-free rate of return to a market
5 risk premium. This market risk premium is adjusted proportionately to reflect
6 the systematic risk of the individual security relative to the market as measured
7 by beta. The traditional CAPM model is expressed as:

$$R_s = R_f + \beta(R_m - R_f)$$

8
9
10 Where: R_s = Return rate on the common stock
11
12 R_f = Risk-free rate of return
13
14 R_m = Return rate on the market as a whole
15
16 β = Adjusted beta (volatility of the security
17 relative to the market as a whole)
18

19 Numerous tests of the CAPM have confirmed its validity. These tests
20 have measured the extent to which security returns and betas are related as
21 predicted by the CAPM. However, Morin observes that while the results
22 support the notion that beta is related to security returns, it has been
23 determined that the empirical Security Market Line (SML) described by the
24 CAPM formula is not as steeply sloped as the predicted SML. Morin²³ states:

25 With few exceptions, the empirical studies agree that ... low-
26 beta securities earn returns somewhat higher than the CAPM
27 would predict, and high-beta securities earn less than predicted.
28

29 * * *

30
31 Therefore, the empirical evidence suggests that the expected

²³ Id., at p. 175.

1 return on a security is related to its risk by the following
2 approximation:
3

$$4 \quad K = R_F + x \beta(R_M - R_F) + (1-x) \beta(R_M - R_F)$$

5
6 where x is a fraction to be determined empirically. The value of
7 x that best explains the observed relationship $\text{Return} = 0.0829$
8 $+ 0.0520 \beta$ is between 0.25 and 0.30. If $x = 0.25$, the equation
9 becomes:
10

$$11 \quad K = R_F + 0.25(R_M - R_F) + 0.75 \beta(R_M - R_F)^{24}$$

12
13 In view of theory and practical research, I have applied both the
14 traditional CAPM and the empirical CAPM to the companies in the proxy
15 groups and averaged the results.

16 **Q. PLEASE DESCRIBE YOUR SELECTION OF A RISK-FREE RATE OF**
17 **RETURN.**

18 A. As shown at the top of column 3 on page 2 of Schedule PMA-11, the risk-free
19 rate adopted for both applications of the CAPM is 5.3%. It is based upon the
20 average consensus forecast of the reporting economists in the July 1, 2007
21 Blue Chip Financial Forecasts as shown in Note 2, page 3, of the expected
22 yields on 30-year U.S. Treasury bonds for the six quarters ending with the
23 fourth calendar quarter 2008.

24 **Q. WHY IS THE PROSPECTIVE YIELD ON LONG-TERM U.S. TREASURY**
25 **BONDS APPROPRIATE FOR USE AS THE RISK-FREE RATE?**

26 A. The yield on long-term T-Bonds is almost risk-free and its term is consistent
27 with the long-term cost of capital to public utilities measured by the yields on A
28 rated public utility bonds, and is consistent with the long-term investment

24 Id., at p. 190.

1 horizon inherent in utilities' common stocks. Therefore, it is consistent with the
2 long-term investment horizon presumed in the standard DCF model employed
3 in regulatory ratemaking. As Morin²⁵ states:

4 As a proxy for the risk-free rate, long-term rates are the relevant
5 benchmarks when determining the cost of common equity
6 rather than short-term or intermediate-term interest rates.<sup>4(footnote
7 omitted)</sup> There are several reasons for this, both conceptual and
8 practical.
9

10 At the conceptual level, because common stock is a long-term
11 investment and because the cash flows to investors in the form
12 of dividends last indefinitely, the yield on very long-term
13 government bonds, namely, the yield on 30-year Treasury
14 bonds, is the best measure of the risk-free rate for use in the
15 CAPM^{5(footnote omitted)} The expected common stock return
16 is based on long-term cash flows, regardless of an individual's
17 holding time period.
18

19 On the grounds of stability and consistency, the yields on long-
20 term Treasury bonds match more closely with expected
21 commons tock returns. Finally, yields on 90-day Treasury Bills
22 typically do not match the investor's planning horizons. Equity
23 investors generally have an investment horizon far in excess of
24 90 days.
25

26 At the practical level, short-term rates are volatile, fluctuate
27 widely, and are subject to more random disturbances than are
28 long-term rates, leading to volatile and unreliable equity return
29 estimates. Short-term rates are also largely administered rates.
30 For example, Treasury Bills are used by the Federal Reserve as
31 a policy vehicle to stimulate the economy and to control the
32 money supply, and are used by foreign governments,
33 companies, and individuals as a temporary safe harbor for
34 money.
35

36 In addition, as noted in the 2007 Yearbook - Valuation Edition²⁶:

37 The horizon of the chosen Treasury security should match the
38 horizon of whatever is being valued. When valuing a business

²⁵ Id., at p. 151.

²⁶ Id., p. 59.

1 that is being treated as a going concern, the appropriate
2 Treasury yield should be that of a long-term Treasury bond.
3 Note that the horizon is a function of the investment, not the
4 investor. If an investor plans to hold stock in a company for
5 only five years, the yield on a five-year Treasury Note would not
6 be appropriate since the Company will continue to exist beyond
7 those five years.
8

9 In conclusion, the average expected yield on 30-year Treasury Bonds is
10 the appropriate proxy for the risk-free rate in the CAPM because it is less
11 volatile than yields on Treasury Bills, is almost risk-free as noted by Morin
12 above and is consistent with the long-term investment horizon implicit in
13 common stocks.

14 **Q. PLEASE EXPLAIN THE ESTIMATION OF THE EXPECTED EQUITY RISK**
15 **PREMIUM FOR THE MARKET.**

16 A. First, I estimate investors' expected total return rate for the market. Then I
17 estimate the expected risk-free rate which I subtract from the expected total
18 return rate for the market. The result is an expected equity risk premium for
19 the market, some proportion of which must be allocated to the companies in
20 the proxy group through the use of beta. As a measure of risk relative to the
21 market as a whole, the beta is an appropriate means by which to apportion the
22 market risk premium to a specific company or group. The total market equity
23 risk premium utilized was 5.8% and is based upon an average of the long-term
24 historical and projected market risk premia.

25 The basis of the projected median market equity risk premium is
26 explained in detail in Note 1 on page 3 of Schedule PMA-11. As previously
27 discussed, it is derived from an average of the most recent 3-month (using the

1 months of April 2007 through June 2007) and a recent spot (July 13, 2007) 3 -
2 5 year median total market price appreciation projections from Value Line, and
3 the long-term historical average from Ibbotson Associates. The appreciation
4 projections by Value Line plus average dividend yield equate to a forecasted
5 annual total return rate on the market of 9.8%. The long-term historical return
6 rate of 12.3% on the market as a whole is from the 2007 Yearbook - Valuation
7 Edition. In each instance, the relevant risk-free rate was deducted from the
8 total market return rate. For example, from the Value Line projected total
9 market return of 9.8%, the forecasted average risk-free rate of 5.3% was
10 deducted indicating a forecasted market risk premium of 4.5%. From the
11 Ibbotson Associates' long-term historical total return rate of 12.3%, the long-
12 term historical income return rate on long-term U.S. Government Securities of
13 5.2% was deducted indicating an historical equity risk premium of 7.1%. Thus,
14 the average of the projected and historical total market risk premia of 4.5% and
15 7.1%, respectively, is 5.8%.

16 **Q. WHAT ARE THE RESULTS OF YOUR APPLICATIONS OF THE**
17 **TRADITIONAL AND EMPIRICAL CAPM TO THE PROXY GROUPS?**

18 A. As shown on Schedule PMA-11, Line No. 1 of page 1, the traditional CAPM
19 cost rate is 10.2% for the proxy group of eight AUS Utility Reports water
20 companies and 10.4% for the proxy group of four Value Line (Std. Ed.) water
21 companies. And, as shown on Line No. 2 of page 1, the empirical CAPM cost
22 rate is 10.2% for the eight water companies and 10.6% for the four Value Line
23 (Std. Ed.) water companies. The traditional and empirical CAPM cost rates are

1 shown individually by company on pages 2 and 3 of Schedule PMA-11. As
2 shown on Line No. 3, the CAPM cost rate applicable to the proxy groups of
3 eight AUS Utility Reports water companies is 10.2% and to the proxy group of
4 four Value Line (Std. Ed.) water companies is 10.5%, based upon the
5 traditional and empirical CAPM results.

6 **Q. SOME CRITICS OF THE ECAPM MODEL CLAIM THAT USING ADJUSTED**
7 **BETAS IN A TRADITIONAL CAPM AMOUNTS TO USING AN ECAPM. IS**
8 **SUCH A CLAIM VALID?**

9 A. No. Using adjusted betas in a CAPM analysis is not equivalent to the ECAPM.
10 Betas are adjusted because of the regression tendency of betas to converge
11 toward 1.0 over time, i.e., over successive calculations of beta. As discussed
12 previously, numerous studies have determined that the Security Market Line
13 (SML) described by the CAPM formula at any given moment in time is not as
14 steeply sloped as the predicted SML. Morin²⁷ states:

15 Some have argued that the use of the ECAPM is inconsistent
16 with the use of adjusted betas, such as those supplied by Value
17 Line and Bloomberg. This is because the reason for using the
18 ECAPM is to allow for the tendency of betas to regress toward
19 the mean value of 1.00 over time, and, since Value Line betas
20 are already adjusted for such trend [sic], an ECAPM analysis
21 results in double-counting. This argument is erroneous.
22 Fundamentally, the ECAPM is not an adjustment, increase or
23 decrease, in beta. This is obvious from the fact that the
24 expected return on high beta securities is actually lower than
25 that produced by the CAPM estimate. The ECAPM is a formal
26 recognition that the observed risk-return tradeoff is flatter than
27 predicted by the CAPM based on myriad empirical evidence.
28 The ECAPM and the use of adjusted betas comprised two
29 separate features of asset pricing. Even if a company's beta is
30 estimated accurately, the CAPM still understates the return for

27 Id., at p. 191.

low-beta stocks. Even if the ECAPM is used, the return for low-beta securities is understated if the betas are understated. Referring back to Figure 6-1, the ECAPM is a return (vertical axis) adjustment and not a beta (horizontal axis) adjustment. Both adjustments are necessary.

Moreover, the slope of the Security Market Line (SML) should not be confused with beta. As Eugene F. Brigham, finance professor emeritus and the author of many financial textbooks states²⁸ :

The slope of the SML reflects the degree of risk aversion in the economy – the greater the average investor's aversion to risk, then (1) the steeper is the slope of the line, (2) the greater is the risk premium for any risky asset, and (3) the higher is the required rate of return on risky assets.¹²

¹²Students sometimes confuse beta with the slope of the SML. This is a mistake. As we saw earlier in connection with Figure 6-8, and as is developed further in Appendix 6A, beta does represent the slope of a line, but *not* the Security Market Line. This confusion arises partly because the SML equation is generally written, in this book and throughout the finance literature, as $k_i = R_F + b_i(k_M - R_F)$, and in this form b_i looks like the slope coefficient and $(k_M - R_F)$ the variable. It would perhaps be less confusing if the second term were written $(k_M - R_F)b_i$, but this is not generally done.

In addition, regulatory support for the ECAPM can be found in the New York Public Service Commission's Generic Financing Docket, Case 91-M-0509. In addition, the Regulatory Commission of Alaska (RCA) in its Order No. 151 in Docket No. P-97-4 re: In the Matter of the Correct Calculation and Use of Acceptable Input Data to Calculate the 1997, 1998, 1999, 2000, 2001 and 2002 Tariff Rates for the Intrastate Transportation of Petroleum over the TransAlaska Pipeline System noted:

Although we primarily rely upon Tesoro's recommendation, we are concerned, however, about Tesoro's CAPM analysis. Tesoro

²⁸ Eugene F. Brigham, Financial Management – Theory and Practice, 4th Ed., The Dryden Press, 1985, p. 203.

1 averaged the results it obtained from CAPM and ECAPM while at
2 the same time providing empirical testimony⁶⁰⁴ (footnote omitted)
3 that the ECAPM results are more accurate than [sic] traditional
4 CAPM results. The reasonable investor would be aware of these
5 empirical results. Therefore, we adjust Tesoro's recommendation to
6 reflect only the ECAPM result.
7

8 In view of the foregoing, using adjusted betas in an ECAPM analysis is
9 not incorrect, nor inconsistent with the financial literature. Rather, the use of
10 the traditional CAPM results in an understated estimate of the cost of common
11 equity capital for a utility with an adjusted beta below 1.00. And
12 notwithstanding regulatory support for the use of only the ECAPM, my CAPM
13 analysis, which includes both the traditional CAPM and the ECAPM, is a
14 conservative approach resulting in a reasonable estimate of the cost of
15 common equity.

16 **E. Comparable Earnings Model (CEM)**

17 **Q. PLEASE DESCRIBE YOUR APPLICATION OF THE COMPARABLE**
18 **EARNINGS MODEL AND HOW IT IS USED TO DETERMINE COMMON**
19 **EQUITY COST RATE.**

20 **A.** My application of the CEM is summarized on Schedule PMA-12 which consists
21 of eight pages. Pages 1 through 3 show the CEM results for the proxy group of
22 eight AUS Utility Reports water companies and pages 4 through 6 show the
23 CEM results for the proxy group of four Value Line (Std. Ed.) water companies.
24 Pages 7 and 8 contain notes related to pages 1 through 6.

25 The comparable earnings approach is derived from the "corresponding
26 risk" standard of the landmark cases of the U.S. Supreme Court. Therefore, it
27 is consistent with the Hope doctrine that the return to the equity investor should

1 be commensurate with returns on investments in other firms having
2 corresponding risks.

3 The CEM is based upon the fundamental economic concept of
4 opportunity cost which maintains that the true cost of an investment is equal to
5 the cost of the best available alternative use of the funds to be invested. The
6 opportunity cost principle is also consistent with one of the fundamental
7 principles upon which regulation rests: that regulation is intended to act as a
8 surrogate for competition and to provide a fair rate of return to investors.

9 The CEM is designed to measure the returns expected to be earned on
10 the book common equity, in this case net worth, of similar risk enterprises.
11 Thus, it provides a direct measure of return, since it translates into practice the
12 competitive principle upon which regulation rests. In my opinion, it is
13 inappropriate to use the achieved returns of regulated utilities of similar risk
14 because to do so would be circular and inconsistent with the principle of
15 equality of risk with non-price regulated firms.

16 The difficulty in application of the CEM is to select a proxy group of
17 companies which are similar in risk, but are not price regulated utilities.
18 Consequently, the first step in determining a cost of common equity using the
19 comparable earnings model is to choose an appropriate proxy group of non-
20 price regulated firms. The proxy group should be broad-based in order to
21 obviate any company-specific aberrations. As stated previously, utilities need
22 to be eliminated to avoid circularity since the returns on book common equity of
23 utilities are substantially influenced by regulatory awards and are therefore not

1 representative of the returns that could be earned in a truly competitive market.

2 **Q. PLEASE DESCRIBE YOUR APPLICATION OF THE CEM.**

3 A. My application of the CEM is market-based in that the selection of non-price
4 regulated firms of comparable risk is based upon statistics derived from the
5 market prices paid by investors.

6 I have chosen two proxy groups of domestic, non-price regulated firms
7 to reflect both the systematic and unsystematic risks of the proxy group of eight
8 AUS Utility Reports water companies and the proxy group of four Value Line
9 (Std. Ed.) water companies, respectively. The proxy group of one hundred
10 forty-two non-utility companies similar in risk to the proxy group of eight AUS
11 Utility Reports water companies and one hundred seventy-three non-utility
12 companies similar in risk to the proxy group of four Value Line (Std. Ed.) water
13 companies are listed on pages 1 through 5, Schedule PMA-12. The criteria
14 used in the selection of these proxy companies were that they be domestic
15 non-utility companies and have a meaningful rate of return on net worth,
16 common equity or partners' capital reported in Value Line (Std. Ed.) for each of
17 the five years ended 2006, or projected for 2010-2012. Value Line betas were
18 used as a measure of systematic risk. The standard error of the regression
19 was used as a measure of each firm's unsystematic or specific risk. The
20 standard error of the regression reflects the extent to which events specific to a
21 company's operations will affect its stock price and, therefore, is a measure of
22 diversifiable, unsystematic, company-specific risk. *In essence, companies*
23 *which have similar betas and standard errors of the regressions, have similar*

1 *investment risk, i.e., the sum of systematic (market) risk as reflected by beta*
2 *and unsystematic (business and financial) risk, as reflected by the standard*
3 *error of the regression, respectively. Those statistics are derived from*
4 *regression analyses using market prices which, under the EMH reflect all*
5 *relevant risks. The application of these criteria results in proxy groups of non-*
6 *price regulated firms similar in risk to the average company in each proxy*
7 *group.*

8 Using a Value Line, Inc. proprietary database dated June 15, 2007, the
9 proxy group of one hundred forty-two non-price regulated companies were
10 chosen based upon ranges of unadjusted beta and standard error of the
11 regression. The ranges were based upon the average standard deviations of
12 the unadjusted beta and the average standard error of the regression for the
13 proxy group of eight AUS Utility Reports water companies.

14 The eight AUS Utility Reports water companies in the proxy group have
15 an average unadjusted beta of 0.67 whose standard deviation is 0.1014 as of
16 June 15, 2007, as shown on page 3, Schedule PMA-12. The average standard
17 error of the regression is 3.2277 as also shown on page 3 of Schedule PMA-
18 12, with a standard deviation of 0.1418 as derived in Note 5, page 7. Ranges
19 of unadjusted betas from 0.37 to 0.97 and of standard errors of the regression
20 from 2.8023 to 3.6531 were used to select the proxy group of one hundred
21 forty-two domestic non-utility companies comparable to the profile of the proxy
22 group of eight AUS Utility Reports water companies as can be gleaned from
23 pages 1 and 2 and explained in Note 1 on page 7 of Schedule PMA-12. These

1 ranges are based upon the proxy group's average unadjusted beta of 0.80 and
2 average standard error of the regression of 3.2277 plus or minus three
3 standard deviations of beta ($0.1014 \times 3 = 0.3042$) and standard error of the
4 regressions ($0.1418 \times 3 = 0.4254$). The use of three standard deviations
5 assures capturing 99.73% of the distribution of unadjusted betas and standard
6 errors, assuring comparability.

7 Likewise, using the same Value Line, Inc. proprietary database dated
8 June 15, 2007, the proxy group of one hundred seventy-three non-price
9 regulated companies were chosen based upon ranges of unadjusted beta and
10 standard error of the regression. The ranges were based upon the average
11 standard deviations of the unadjusted beta and the average standard error of
12 the regression for the proxy group of four Value Line (Std. Ed.) water
13 companies.

14 The four Value Line (Std. Ed.) water companies in the proxy group
15 have an average unadjusted beta of 0.81 whose standard deviation is 0.1003
16 as of June 15, 2007, as shown on page 6, Schedule PMA-12. The average
17 standard error of the regression is 3.1940 as also shown on Schedule PMA-12,
18 page 6 with a standard deviation of 0.1403 as derived in Note 10, page 8.
19 Ranges of unadjusted betas from 0.51 to 1.11 and of standard errors of the
20 regression from 2.7731 to 3.6149 were used to select the proxy group of one
21 hundred seventy-three domestic non-utility companies comparable to the
22 profile of the proxy group of four Value Line (Std. Ed.) water companies as can
23 be gleaned from pages 3 through 5 and explained in Note 9 on pages 6 and 7

1 of Schedule PMA-12. These ranges are based upon the proxy group's
2 average unadjusted beta of 0.81 and average standard error of the regression
3 of 3.1940 plus or minus three standard deviations of beta ($0.1003 \times 3 = 0.3009$)
4 and standard error of the regressions ($0.1403 \times 3 = 0.4209$). The use of three
5 standard deviations assures capturing 99.73% of the distribution of unadjusted
6 betas and standard errors, assuring comparability.

7 I believe that this methodology for selecting non-price regulated firms of
8 similar total risk (i.e., non-diversifiable systematic and diversifiable non-
9 systematic risk) is meaningful and effectively responds to the criticisms
10 normally associated with the selection of firms presumed to be comparable in
11 total risk. This is because the selection of non-price regulated companies
12 comparable in total risk is based upon regression analyses of market prices
13 which reflect investors' assessment of all risks, diversifiable and non-
14 diversifiable. Thus, the empirical selection process results in companies
15 comparable in both systematic and unsystematic risks, i.e., total risk.

16 Once proxy groups of non-price regulated companies are selected, it is
17 then necessary to derive returns on book common equity, net worth or partners'
18 capital for the companies in the groups. I have measured these returns using
19 the rate of return on net worth, common equity or partners' capital reported by
20 Value Line (Standard Edition). It is reasonable to measure these returns over
21 both the most recent historical five-year period as well as those projected over
22 the ensuing five-year period.

23 **Q. WHAT ARE YOUR CONCLUSIONS OF CEM COST RATE?**

1 A. Conclusions of CEM cost rates are 16.7% for the proxy group of eight AUS
2 Utility Reports water companies as shown on page 3 of Schedule PMA-12 and
3 15.8%, for the proxy group of four Value Line (Std. Ed.) water companies as
4 shown on page 6. Note that I have applied a test of significance (Student's t-
5 statistic) to determine whether any of the historical or projected returns are
6 significantly different from their respective means at the 95% confidence level.
7 As a result, the historical and the projected means of several companies have
8 been excluded.

9 I have also eliminated from the groups of non-price regulated
10 companies, all those rates of return which are 20.0% or greater and 8.6% and
11 below, i.e., 200 basis points above the current prospective yield of 6.6% on
12 Moody's A rated public utility bonds (see page 1 of Schedule PMA-10) for
13 reasons discussed previously. Such an elimination results in an arithmetic
14 mean return rate of 14.4% on an historical five-year basis and 14.2% on a
15 projected five-year basis for the eight AUS Utility Reports water companies and
16 14.3% on an historical five-year basis and 14.1% on a projected five-year basis
17 for the four Value Line (Std. Ed.) water companies as shown on pages 3 and 6
18 of Schedule PMA-12, respectively. I rely upon the midpoint of the arithmetic
19 mean historical five-year and projected five-year rates of return of 14.3% for
20 the proxy group of eight AUS Utility Reports water companies and 14.2% for
21 the proxy group of four Value Line (Std. Ed.) water companies as my CEM
22 conclusions.

23 IX. CONCLUSION OF COMMON EQUITY COST RATE RANGE

1 **Q. WHAT IS YOUR RECOMMENDED COMMON EQUITY COST RATE RANGE?**

2 A. It is 11.40% - 12.00% based upon the common equity cost rates resulting from
3 all four cost of common equity models consistent with the EMH which logically
4 mandates the use of multiple cost of common equity models as adjusted for
5 USSC's greater business and financial risk.

6 In formulating my recommended common equity cost rate range of
7 11.40% - 12.00%, I reviewed the results of the application of four different cost
8 of common equity models, namely, the DCF, RPM, CAPM, and CEM for the
9 two proxy groups. I employ all four cost of common equity models as primary
10 tools in arriving at my recommended common equity cost rate range because
11 no single model is so inherently precise that it can be relied upon solely, to the
12 exclusion of other theoretically sound models. As discussed above, all four
13 models are based upon the Efficient Market Hypothesis (EMH), and therefore,
14 have application problems associated with them. The EMH, as also previously
15 discussed, requires the assumption that investors rely upon multiple cost of
16 common equity models. Moreover, as demonstrated in this testimony, the
17 prudence of using multiple cost of common equity models is supported in the
18 financial literature. Therefore, none should be relied upon exclusively to
19 estimate investors' required rate of return on common equity.

20 In a market environment where market value deviates significantly from
21 book value (lower or higher), sole reliance on the DCF model is particularly
22 problematic for a regulated utility because its application results in both a
23 practical and theoretical overstatement or understatement, respectively, of

investors' required rate of return. Investors expect to achieve their required rate of return based upon dividends received and appreciation in market price. This testimony has shown that market prices are significantly influenced by factors other than earnings per share (EPS) and dividends per share (DPS). Thus, because it is necessary to use accounting proxies for growth in the DCF model (such as EPS, DPS, or their derivative, internal growth), that model does not reflect the full extent of market price growth expected by investors. Market prices reflect other factors affecting growth not accounted for in the standard regulatory version of the DCF model such as an increase in the market value per share due to expected increases in price/earnings multiples and less obvious factors included in the long-range goals of investors. For these reasons, sole reliance on the DCF model should be avoided. In fact, as discussed in detail above, state commissions in Iowa, Indiana and Hawaii have questioned their previous primary reliance upon the DCF, having explicitly recognized this tendency of the DCF model to understate the common equity cost rate when, as now, market prices significantly exceed book values.

The results of the four cost of common equity models applied to the proxy groups of eight AUS Utility Reports water companies and four Value Line (Std. Ed.) water companies are shown on Schedule PMA-1, page 2 and summarized below:

Table 4

Proxy Group of Eight AUS Utility Reports <u>Water Cos.</u>	Proxy Group of Four Value Line (Std. Ed.) <u>Water Cos.</u>
--	---

Discounted Cash Flow Model	9.8%		10.1%
Risk Premium Model	10.8		11.0
Capital Asset Pricing Model	10.2		10.5
Comparable Earnings Model	14.3		14.2
Indicated Common Equity Cost Rate Before Business Risk Adjustment	10.80%	--	11.40%
Business Risk Adjustment	<u>0.30</u>		<u>0.30</u>
Indicated Common Equity Cost Rate After Adjustment for Business Risk	11.10%	--	11.70%
Financial Risk Adjustment	<u>0.30</u>		<u>0.30</u>
Recommended Range of Common Equity Cost Rate	<u>11.40% - 12.00%</u>		

Based upon these common equity cost rate results, I conclude that a common equity cost rate in the range of 10.80% to 11.40% is indicated based upon the use of multiple common equity cost rate models applied to the market data of both proxy groups and before any adjustment for USSC's greater relative business and financial risk as shown on Line No. 5, page 2 of Schedule PMA-1.

Q. IS THERE A WAY TO QUANTIFY A BUSINESS RISK ADJUSTMENT DUE TO USSC'S SMALL SIZE RELATIVE TO THE TWO PROXY GROUPS?

A. Yes. As discussed previously, USSC has greater business risk than the average proxy group company because of its smaller size relative to each proxy group, whether measured by book capitalization or the market capitalization of common equity (estimated market value for USSC, whose common stock is not traded). Therefore, it is necessary to upwardly adjust the common equity cost rates of 10.80% to 11.40% based upon the two proxy groups. Based upon USSC's small relative size, an adjustment to reflect its

1 smaller relative size of 3.78% (378 basis points) relative to the conclusion of
2 common equity cost rate of the eight AUS Utility Reports water companies and
3 4.65% (465 basis points) relative to the conclusion of common equity cost rate
4 of the four Value Line (Std. Ed.) water companies are indicated. These
5 adjustments are based upon data contained in the 2007 Yearbook - Valuation
6 Edition. The determinations are based on the size premia for decile portfolios
7 of New York Stock Exchange (NYSE), American Stock Exchange (AMEX) and
8 NASDAQ listed companies for the 1926-2006 period and related data shown
9 on pages 3 through 18 of Schedule PMA-1. The average size premia for the
10 deciles in which the proxy groups fall have been compared to the average size
11 premia for the 10th decile in which USSC would fall if its stock were traded and
12 sold at the July 10, 2007 average market/book ratio of either 227.4% or
13 228.7% experienced by each proxy group, respectively. As shown on page 3
14 of Schedule PMA-1, the size premium spread between USSC and the eight
15 water companies is 3.78% and 4.65% between USSC and the four Value Line
16 (Std. Ed.) water companies. Page 4 contains notes relative to page 3. Page 5
17 contains data in support of page 3 while pages 6 through 18 of Schedule PMA-
18 1 contain relevant information from the 2007 Yearbook - Valuation Edition
19 discussed previously.

20 Consequently, business risk adjustments of 3.78% and 4.65% are
21 indicated for the eight water companies and the four Value Line (Std. Ed.)
22 water companies, respectively. However, I will make conservatively reasonable
23 business risk adjustments of 0.30% (30 basis points) to the indicated common

equity cost rate of 10.80% to 11.40%. This results in a range of business risk adjusted common equity cost rate of 11.10% to 11.70%. In my opinion, such a cost rate is both reasonable and conservative and will provide USSC with sufficient earnings to enable it to attract necessary new capital.

Q. IS THERE A WAY TO QUANTIFY A FINANCIAL RISK ADJUSTMENT DUE TO USSC'S GREATER FINANCIAL RISK RELATIVE TO THE TWO PROXY GROUPS?

A. Yes. As previously discussed, the Company's requested common equity ratio at December 31, 2006, 40.17%, is significantly lower than the common equity and even the total equity (the sum of preferred stock and common equity) ratios maintained, on average, by the companies in the two proxy groups. Thus, USSC has greater financial risk than the companies in either of the two proxy groups. Because investors require a higher return in exchange for bearing high risk, an upward adjustment to the common equity cost rates derived from the market data of water companies with a lower degree of financial risk than USSC is necessary.

A study by Brigham, Gapenski and Aberwald²⁹ concluded that a 1 percentage point change in common equity ratio in the range of 40.0% to 50.0% results in an average 12 basis point change in common equity cost rate with the change approximately 15 basis points at the lower end of the range, i.e., near 40.0%, and approximately 7 basis points at the higher end of the range, i.e., near 50.0%. Clearly, the lower the common equity ratio, the higher

²⁹ Eugene F. Brigham, Louis C. Gapenski, and Dana A. Aberwald, "Capital Structure, Cost of Capital, and Revenue Requirements", Public Utilities Fortnightly, January 8, 1987, pp. 15-24.

1 the common equity cost rate, all else equal. As shown on page 3 of Schedule
2 PMA-3, the proxy group of eight AUS Utility Reports water companies
3 maintained a common equity ratio of 50.96% in 2006 on average. The proxy
4 group of four Value Line (Std. Ed.) water companies maintained a common
5 equity ratio of 52.66% in 2006 on average as shown on page 3 of Schedule
6 PMA-4. Thus, an adjustment to the range of common equity cost rate based
7 upon the two proxy groups and the 1,079 basis points (10.79%) and 1,249
8 basis points (12.49%) difference between the average 2006 common equity
9 ratios of the two proxy groups³⁰ can be derived as follows: $1.29\% = [(50.96\%$
10 $- 40.17\%) * 0.12\%] = [(10.79\% \times 0.12\%)$ and $1.50 = [(52.66\% - 40.17\%) *$
11 $0.12\%] = [12.49\% * 0.12\%]$.

12 Consequently, financial risk adjustments of 1.29% and 1.50% are
13 indicated for the eight water companies and the four water companies,
14 respectively. However, I will make a conservatively reasonable financial risk
15 adjustment of 0.30% (30 basis points) to the range of indicated common equity
16 cost rates of 11.10% to 11.70% as adjusted for business risk. This results in a
17 range of financial and business risk adjusted common equity cost rates of
18 11.40% to 12.00%, which is my recommended range of common equity cost
19 rate and which in my opinion is both reasonable and conservative. A common
20 equity cost rate range of 11.40% to 12.00% will provide USSC with sufficient
21 earnings to enable it to attract necessary new capital.

22 **Q. CAN YOU PROVIDE A CHECK ON THE REASONABLENESS OF YOUR**

³⁰ See page 3 of Schedule PMA-3 and PMA-4. 10.29% is the difference between the average 2006 common equity ratio of the eight water companies, 50.96% and USSC's proposed common equity ratio of 40.17%.

1 **RECOMMENDED COMMON EQUITY COST RATE RANGE?**

2 A. Yes. As shown on Schedule PMA-13, the average authorized ROE for all
3 litigated electric and natural gas rate cases for the twelve months ended June
4 30, 2007 was 10.35% relative to an average common equity ratio of 47.72%.
5 Although USSC is a water and wastewater utility, it is appropriate to review
6 authorized awards for electric and gas utilities as all utilities compete not only
7 with each other but with non-regulated firms for capital in the capital markets.
8 As shown, the average awarded ROE of 10.35% indicated an average equity
9 risk premium of 4.42% over the yield on Moody's A rated utility bonds in the
10 months prior to the awards. The average yield on A rated utility bonds for
11 those litigated cases was 5.93%. The projected yield on A rated utility bonds is
12 6.60%, as previously discussed. The 6.60% yield plus an equity risk premium
13 of 4.42% equals an ROE of 11.02%, which verifies the reasonableness of a
14 range of common equity cost rate of 11.40% - 12.00% given USSC's extremely
15 small size and greater financial risk as discussed previously. Adding my
16 recommended business risk adjustment of 0.30% and financial risk adjustment
17 of 0.30% to the 11.02% ROE indicated based upon authorized awards yields a
18 risk adjusted ROE of 11.62% (11.62% = 11.02% + 0.30% + 0.30%).
19 Consequently, my recommended range of common equity cost rate of 11.40%
20 - 12.00% is reasonable.

21 **Q. DOES THAT CONCLUDE YOUR DIRECT TESTIMONY?**

Likewise, 12.49% is the difference between the average 2005 common equity ratio of the four water companies, 52.66%

1 A. Yes.

and 40.17% (10.79% = 50.96% - 40.17%) and (12.49% = 52.66% and 40.17%).

PROFESSIONAL EXPERIENCE

1996-Present

As a Principal, I offer testimony as an expert witness on the subjects of fair rate of return and cost of capital before state public utility commissions. I provide assistance and support to clients throughout the entire ratemaking litigation process.

1994-1996

As an Assistant Vice President, I prepared fair rate of return and cost of capital exhibits which are filed along with expert testimony before various state and federal public utility regulatory bodies. These supporting exhibits include the determination of an appropriate ratemaking capital structure and the development of embedded cost rates of senior capital. The exhibits also support the determination of a recommended return on common equity through the use of various market models, such as, but not limited to, Discounted Cash Flow analysis, Capital Asset Pricing Model and Risk Premium Methodology, as well as an assessment of the risk characteristics of the client utility. I also assisted in the preparation of responses to any interrogatories received regarding such testimonies filed on behalf of client utilities. Following the filing of fair rate of return testimonies, I assisted in the evaluation of opposition testimony in order to prepare interrogatory questions, areas of cross-examination, and rebuttal testimony. I also evaluated and assisted in the preparation of briefs and exceptions following the hearing process. I have submitted testimony before state public utility commissions regarding appropriate capital structure ratios and fixed capital cost rates.

1990-1994

As a Senior Financial Analyst, I supervised two analysts in the preparation of fair rate of return and cost of capital exhibits which are filed along with expert testimony before various state and federal public utility regulatory bodies. The team also assisted in the preparation of interrogatory responses.

I evaluated the final orders and decisions of various commissions to determine whether further actions are warranted and to gain insight which may assist in the preparation of future rate of return studies.

I assisted in the preparation of an article authored by Frank J. Hanley and A. Gerald Harris entitled "Does Diversification Increase the Cost of Equity Capital?" published in the July 15, 1991 issue of Public Utilities Fortnightly.

I co-authored an article with Frank J. Hanley entitled "Comparable Earnings: New Life for an Old Precept" which was published in the American Gas Association's Financial Quarterly Review, Summer 1994.

I was awarded the professional designation "Certified Rate of Return Analyst" (CRRA) by the National Society of Rate of Return Analysts (now the Society of Utility and Regulatory Financial Analysts (SURFA)). This designation is based upon education, experience and the successful completion of a comprehensive examination.

As Administrator of Financial Analysis for AUS Utility Reports, which reports financial data for over 200 utility companies and has approximately 1,000 subscribers, I oversee the preparation of this monthly publication, as well as the annual publication, Financial Statistics - Public Utilities.

1988-1990

As a Financial Analyst, I assisted in the preparation of fair rate of return studies including capital structure determination, development of senior capital cost rates, as well as the determination of an appropriate rate of return on equity. I also assisted in the preparation of interrogatory responses, interrogatory questions of the opposition, areas of cross-examination and rebuttal testimony. I also assisted in the preparation of the annual publication C. A. Turner Utility Reports - Financial Statistics - Public Utilities.

1973-1975

As a research assistant in the Research Department of the Regional Economics Division of the Federal Reserve Bank of Boston, I was involved in the development and maintenance of econometric models to simulate regional economic conditions in New England in order to study the effects of, among other things, the energy crisis of the early 1970's and property tax revaluations on the economy of New England. I was also involved in the statistical analysis and preparation of articles for the New England Economic Review. Also, I acted as assistant editor for New England Business Indicators.

1972

As a research assistant in the Office of the Assistant Secretary for International Affairs, U.S. Treasury Department, Washington, D.C., I developed and maintained econometric models which simulated the economy of the United States in order to study the results of various alternate foreign trade policies so that national trade policy could be formulated and recommended.

I am also a member of the Society of Utility and Regulatory Financial Analysts (formerly the National Society of Rate of Return Analysts).

Clients Served

I have offered expert testimony before the following commissions:

Arkansas	Michigan
California	Missouri
Connecticut	Nevada
Delaware	New Jersey
Florida	New York
Hawaii	North Carolina
Idaho	Ohio
Illinois	Pennsylvania
Indiana	South Carolina
Kentucky	Virginia
Maine	Washington
Maryland	

I have sponsored testimony on the rate of return and capital structure effects of merger and acquisition issues for:

California-American Water Company

New Jersey-American Water Company

I have sponsored testimony on fair rate of return and related issues for:

Alpena Power Company	Pittsburgh Thermal
Aqua Illinois, Inc.	Spring Creek Utilities, Inc.
Aqua New Jersey, Inc.	Sussex Shores Water Company
Aqua Virginia, Inc.	Tega Cay Water Service, Inc.
Audubon Water Company	Twin Lakes Water Service, Inc.
Carolina Pines Utilities, Inc.	Thames Water Americas
Carolina Water Service, Inc.	Tidewater Utilities, Inc.
Consumers Illinois Water Company	Transylvania Utilities, Inc.
Consumers Maine Water Company	Twin Lakes Utilities, Inc.
Consumers New Jersey Water Company	United Utility Companies
City of DuBois, Pennsylvania	United Water Arkansas, Inc.
Elizabethtown Water Company	United Water Connecticut, Inc.
Emporium Water Company	United Water Delaware, Inc.
GTE Hawaiian Telephone Inc.	United Water Idaho, Inc.
Greenridge Utilities, Inc.	United Water Indiana, Inc.
Borough of Hanover, Pennsylvania	United Water New Jersey, Inc.
Illinois American Water Company	United Water New Rochelle, Inc.
Iowa-American Water Company	United Water New York, Inc.
Long Neck Water Company	United Water Owego, Inc/Nichols, Inc.
Massanutten Public Service Corp.	United Water Pennsylvania, Inc.
Middlesex Water Company	United Water Virginia, Inc.
Missouri-American Water Company	United Water West Lafayette, Inc.
Mt. Holly Water Company	Utilities, Inc. of Central Nevada
Nero Utility Services, Inc.	Utilities, Inc. of Florida
New Jersey-American Water Company	Utilities Services of South Carolina
NRG Energy Center Pittsburgh	Utility Center, Inc.
Ohio-American Water Company	Valley Energy, Inc.
Penn Estates	Water Service Corp. of Kentucky
Pinelands Waste Water Company	Wellsboro Electric Company
Pinelands Water Company	Western Utilities, Inc.

I have sponsored testimony on capital structure and senior capital cost rates for the following clients:

Alpena Power Company	PG Energy Inc.
Arkansas-Western Gas Company	United Water Delaware, Inc.
Associated Natural Gas Company	Washington Natural Gas Company

I have assisted in the preparation of rate of return studies on behalf of the following clients:

Algonquin Gas Transmission Company	CWS Systems, Inc.
Arkansas-Louisiana Gas Company	Delmarva Power & Light Company
Arkansas Western Gas Company	East Honolulu Community Services, Inc.
Artesian Water Company	Equitable Gas Company
Associated Natural Gas Company	Equitrans, Inc.
Atlantic City Electric Company	Florida Power & Light Company
Bridgeport-Hydraulic Company	Gary Hobart Water Company
Cambridge Electric Light Company	Gasco, Inc.
Carolina Power & Light Company	GTE Arkansas, Inc.
Citizens Gas and Coke Utility	GTE California, Inc.
City of Vernon, CA	GTE Florida, Inc.
Columbia Gas/Gulf Transmission Cos.	GTE Hawaiian Telephone
Commonwealth Electric Company	GTE North, Inc.
Commonwealth Telephone Company	GTE Northwest, Inc.
Conestoga Telephone & Telegraph Co.	GTE Southwest, Inc.
Connecticut Natural Gas Corporation	Great Lakes Gas Transmission L.P.
Consolidated Gas Transmission Company	
Consumers Power Company
